

# Semileptonic D-decays at BESIII

An Fenfen

On behalf of the BESIII collaboration

7<sup>th</sup> Charm Meeting  
May 18-22, 2015

# Outline

- Measurement Technique
- Study of  $D^+ \rightarrow K^- \pi^+ e^+ \nu_e$
- Study of  $D^+ \rightarrow \omega(\phi) e^+ \nu_e$
- Study of  $D^+ \rightarrow K_L e^+ \nu_e$

# Measurement Technique

- About  $2.92 \text{ fb}^{-1}$  of data is collected at  $\psi(3770)$ , which ensures a pure  $D\bar{D}$  final state with no additional final state hadrons. In events where one  $D$  is fully reconstructed, semileptonic signals are searched at the recoiling side.
- Branching fractions can be obtained using:

$$\text{Br}(D^+ \rightarrow X e^+ \nu_e) = \frac{N_{\text{sig}}}{\sum_{\alpha} N_{\text{tag}}^{\text{obs},\alpha} \epsilon_{\text{tag,sig}}^{\alpha} / \epsilon_{\text{tag}}^{\alpha}}$$

$N_{\text{sig}}$  is the number of semileptonic candidates,  $N_{\text{tag}}^{\text{obs},\alpha}$  the number of observed tagged mode  $\alpha$ , while  $\epsilon_{\text{tag}}^{\alpha}$  and  $\epsilon_{\text{tag,sig}}^{\alpha}$  the reconstruction efficiencies of tagged mode  $\alpha$  and both the tagged and semileptonic mode.

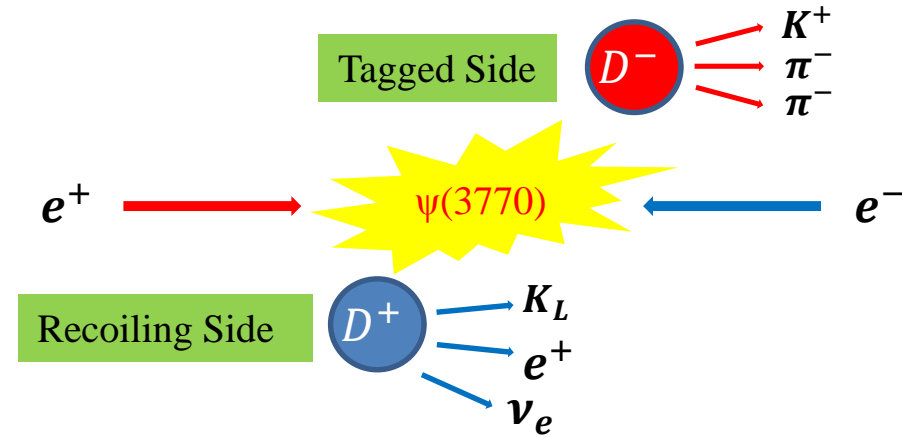

- Six hadronic decay modes are chosen as tags:

$$D^+ \rightarrow K^- \pi^+ \pi^+, \quad D^+ \rightarrow K^- \pi^+ \pi^+ \pi^0, \quad D^+ \rightarrow K_S^0 \pi^+$$

$$D^+ \rightarrow K_S^0 \pi^+ \pi^0, \quad D^+ \rightarrow K_S^0 \pi^+ \pi^+ \pi^-, \quad D^+ \rightarrow K^+ K^- \pi^+$$

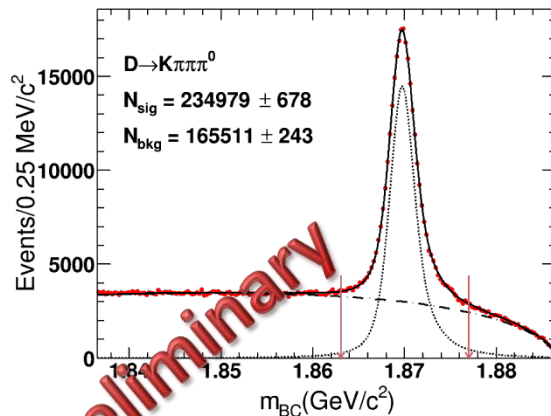

- Tags are selected based on two variables, and tag yield is obtained by fitting  $m_{BC}$ .

$$\Delta E = E_D - E_{\text{beam}}, \quad m_{BC} = \sqrt{E_{\text{beam}}^2 - |\vec{p}_D|^2}$$

# $m_{BC}$ Distribution

Tag yield is obtained by fitting  $m_{BC}$ . In the case of  $D^+ \rightarrow K^- \pi^+ e^+ \nu_e$  study, the fits are illustrated as below.

BESIII Preliminary

Signal: MC shape convoluting a double Gaussian; Background : Argus Function

# Study of $D^+ \rightarrow K^- \pi^+ e^+ \nu_e$

In the  $D^+ \rightarrow K^- \pi^+ e^+ \nu_e$  decay, we can measure:

- Branching fractions
- The fractions and properties of different  $K\pi$  (non-)resonant amplitudes
  - S: non-resonant,  $K_0^*(1430)$
  - P:  $K^*(892)$ ,  $K^*(1410)$
  - D:  $K_2^*(1430)$
- $q^2$  dependent transition form factors in  $D^+ \rightarrow \bar{K}^{*0}(892)e^+\nu_e$  ( $q^2$  is the invariant mass of  $e^+\nu_e$ )
  - The  $D^+ \rightarrow \bar{K}^{*0}(892)e^+\nu_e$  decay can be described in terms of 3 helicity basis form factors:  $H_{\pm,0}(q^2)$  (Any dependence on the lepton mass is neglected), which are measured in a model-independent way
  - $H_{\pm,0}(q^2)$  are generally written as linear combinations of a vector ( $V(q^2)$ ) and two axial-vector ( $A_{1,2}(q^2)$ ) form factors, which are measured based on SPD (Spectroscopic Pole Dominance) model in the amplitude analysis

These measurements are important to compare with theoretical calculations and previous experiments

# Branching Fraction

- A nearly background-free ( $\sim 0.7\%$ ) sample of more than 18000 candidates is selected. The  $m_{K\pi}$  distribution is shown on the right.

- Branching fractions over the whole  $m_{K\pi}$  range and in the  $K^{*0}$  (892) dominated window  $[0.8, 1]$   $\text{GeV}/c^2$  are calculated:

$$Br(D^+ \rightarrow K^- \pi^+ e^+ \nu_e) = (3.71 \pm 0.03 \pm 0.09)\%$$

$$Br(D^+ \rightarrow K^- \pi^+ e^+ \nu_e)_{[0.8,1]} = (3.33 \pm 0.03 \pm 0.08)\%$$

- Amplitude analysis is performed based on this sample (see next page). The differential decay width of the  $D^+ \rightarrow K^- \pi^+ e^+ \nu_e$  decay can be fully described using:

[citation: N. Cabibbo and A. Maksymowicz, Phys. Rev. 137, B438 (1965)]

- $m_{K\pi}$  - inv. mass squared of  $K\pi$
- $q^2$  - inv. mass of  $e^+ \nu_e$
- $\theta_K, \theta_e, \chi$  angles

# Amplitude Analysis

## PDF Parameterization

(citation: BABAR Collaboration, Phys. Rev. D 83, 072001 (2011))

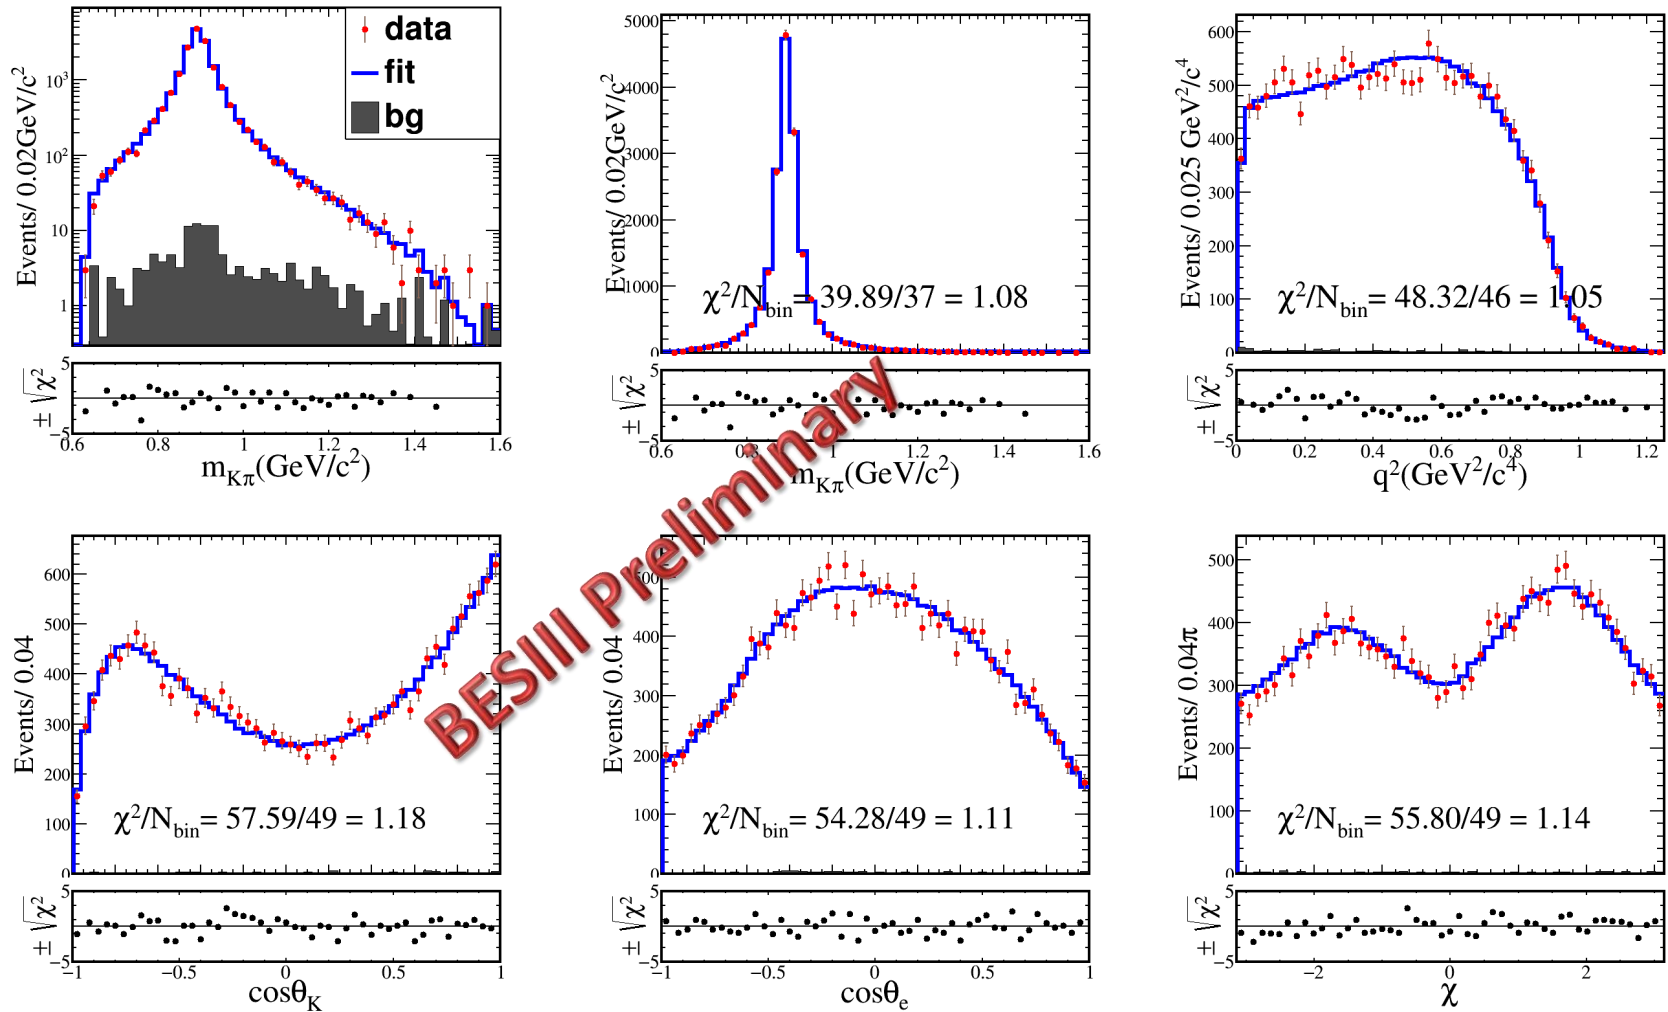

- ◆ Unbinned Maximum likelihood fit (background considered)
- ◆ Non-resonant S-wave amplitude:  
Magnitude: polynomial variation with  $m_{K\pi}$   
Phase  $\delta_S$ : same as in LASS scattering experiment [Nucl. Phys. B296, 493 (1988)]
- ◆ Other amplitudes: Breit-Wigner function with mass-dependent width
- ◆ Form factors are parameterized based on SPD model:

$$V(q^2) = \frac{V(0)}{1 - q^2/m_V^2}, \quad A_{1,2}(q^2) = \frac{A_{1,2}(0)}{1 - q^2/m_A^2}$$

## Fit Results with S+P (preliminary)

- ◆ The fractions of the components can be extracted
$$f(D^+ \rightarrow (K^- \pi^+)_{K^{*0}(892)} e^+ \nu_e) = (93.93 \pm 0.22 \pm 0.18)\%$$
$$f(D^+ \rightarrow (K^- \pi^+)_{S\text{-wave}} e^+ \nu_e) = (6.05 \pm 0.22 \pm 0.18)\%$$
other components have significances less than  $5\sigma$  and correspond to fractions below 1%
- ◆ The S-wave phase measured from amplitude analysis is illustrated in the following pages
- ◆  $m_{K^{*0}(892)} = (894.60 \pm 0.25 \pm 0.08) \text{ MeV}/c^2$ 
$$\Gamma_{K^{*0}(892)} = (46.42 \pm 0.56 \pm 0.15) \text{ MeV}/c^2$$
$$r_{BW} = (3.07 \pm 0.26 \pm 0.11) (\text{GeV}/c)^{-1}$$
- ◆  $m_V = (1.81_{-0.17}^{+0.25} \pm 0.02) \text{ GeV}/c^2$  (first measurement)
$$m_A = (2.61_{-0.17}^{+0.22} \pm 0.03) \text{ GeV}/c^2$$
$$A_1(0) = 0.573 \pm 0.011 \pm 0.020$$
$$r_V = V(0)/A_1(0) = 1.411 \pm 0.058 \pm 0.007$$
$$r_2 = A_2(0)/A_1(0) = 0.788 \pm 0.042 \pm 0.008$$

# Projections of data and fitted MC distribution

The signal contains S-wave and  $K^{*0}(892)$  components.

In the lower histograms,  $\chi$  of the (combined) bins of the upper histograms are provided.

# S-wave Phase Measurement

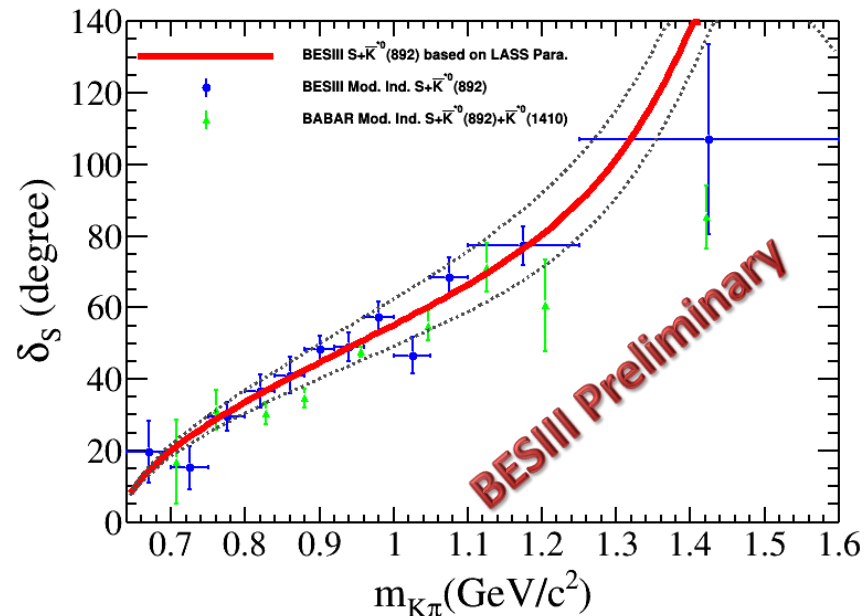

Instead of using the LASS parameterization for  $\delta_S$ , we fit the phase in different  $m_{K\pi}$  intervals, assuming  $\delta_S$  remains constant within each interval.

- Bin division: similar size for each bin, wider for the last two due to low population
- $K^{*0}(892)$  related parameters are also set free
- Blue dots: BESIII Model-independent measurement

Red or dotted lines: predicted by fit based on LASS parameterization

Green dots: BABAR Model-independent measurement with  $S+\bar{K}^{*0}(892) + \bar{K}^{*0}(1410)$

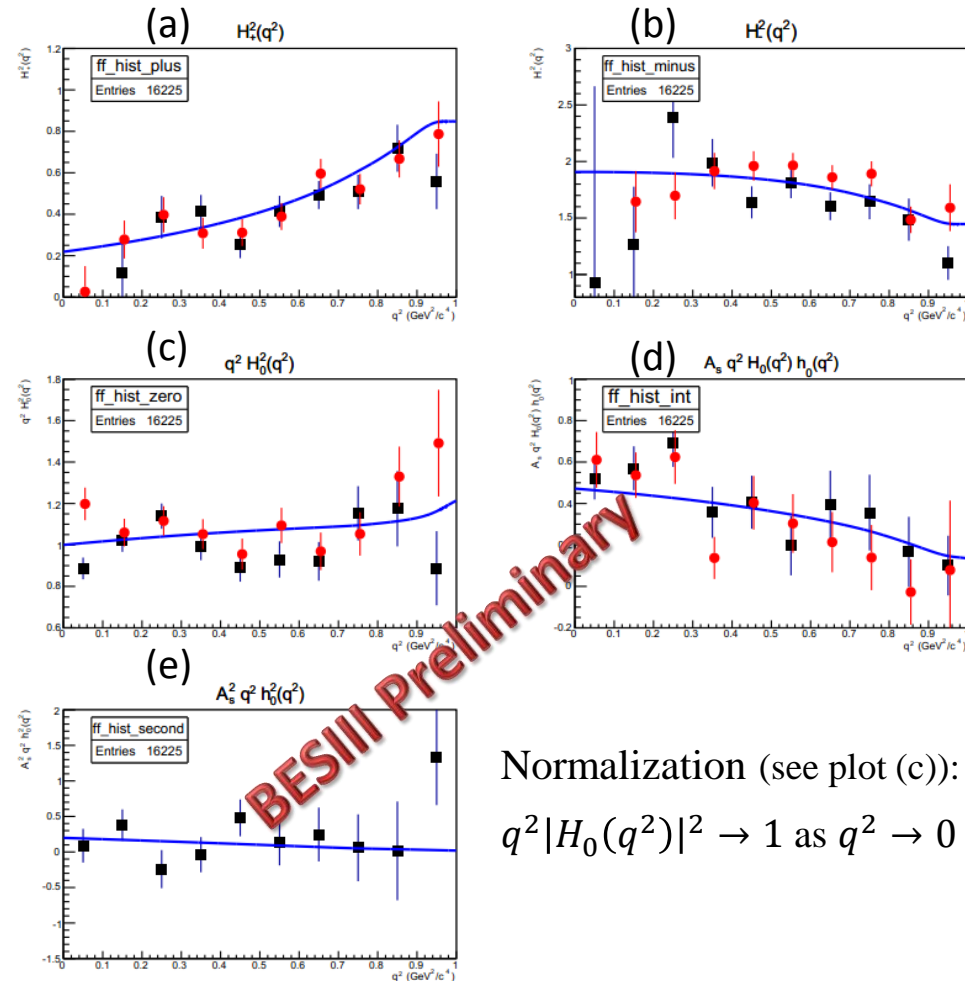

[citation: BABAR Collaboration, Phys. Rev. D 83, 072001 (2011)]

Model-independent measurement of BESIII are consistent with its result from amplitude analysis within  $1\sigma$ .

# Model-Independent Measurement of Form Factors

- Events located in the  $K^{*0}(892)$  window  $[0.8,1] \text{ GeV}/c^2$ , are used to measure the form factors by a Projective Weighting Technique [citation: CLEO collaboration, Phys. Rev. D 81, 112001 (2010)].
- Signal is assumed to be composed of  $K^{*0}(892)$  and a non-resonant S-wave.
- Helicity basis form factors include:
  - P-wave related:  $H_{\pm,0}(q^2)$
  - S-wave related:  $h_0(q^2)$
- Five weighted  $q^2$  histograms are built. Weight is assigned to each event based on  $(q^2, \cos\theta_K, \cos\theta_e)$ .
- Form factors are independently computed in each  $q^2$  bin.
- The model-independent measurements are generally consistent with CLEO's report and the predicted trend based on the SPD model from amplitude analysis.

Normalization (see plot (c)):  
 $q^2 |H_0(q^2)|^2 \rightarrow 1$  as  $q^2 \rightarrow 0$

Red dots : BESIII model-independent measurement  
 Black dots : CLEO model-independent measurement  
 Blue Line : BESIII result from amplitude analysis, which is based on SPD model and mass-dependent S-wave

Notice: The lines are not simple fits of these dots!

# Study of $D^+ \rightarrow \omega(\phi)e^+\nu_e$

- Current status of  $D^+ \rightarrow \omega(\phi)e^+\nu_e$

$D^+$ Decay Modes	Fraction	Confidence level
$D^+ \rightarrow \omega e^+ \nu_e$	$(1.82 \pm 0.18 \pm 0.07) \times 10^{-3}$	
$D^+ \rightarrow \phi e^+ \nu_e$	$< 9.0 \times 10^{-5}$	CL=90%

- Form factors of  $D^+ \rightarrow \omega e^+ \nu_e$  have never been measured before
- No significant excess of  $D^+ \rightarrow \phi e^+ \nu_e$  is observed
- $D^+ \rightarrow \phi e^+ \nu_e$  decay proceeds only through  $\omega - \phi$  mixing or non-perturbative “Weak Annihilation” (WA) process (see Fig (b)). Measurement of its branching ratio can help to judge the dominant process.

(a) Feynman diagram representing the charged current process  $D^+ \rightarrow \omega e^+ \nu_e$

(b) Feynman diagram representing the WA process  $D^+ \rightarrow \phi e^+ \nu_e$

# Branching Fraction

- Semileptonic decays are identified using the variable  $U$ :

$$U = E_{miss} - |\vec{p}_{miss}|, \quad E_{miss} = E_{beam} - E_{\omega(\phi)} - E_e$$

$$\vec{P}_{miss} = -\vec{P}'_{tag} - \vec{P}_{\omega(\phi)} - \vec{P}_e, \quad \vec{P}'_{tag} = \vec{P}_{tag} \sqrt{E_{beam}^2 - m_D^2}$$

- $U$  distribution for the  $D^+ \rightarrow \omega(\phi)e^+\nu_e$  decay:

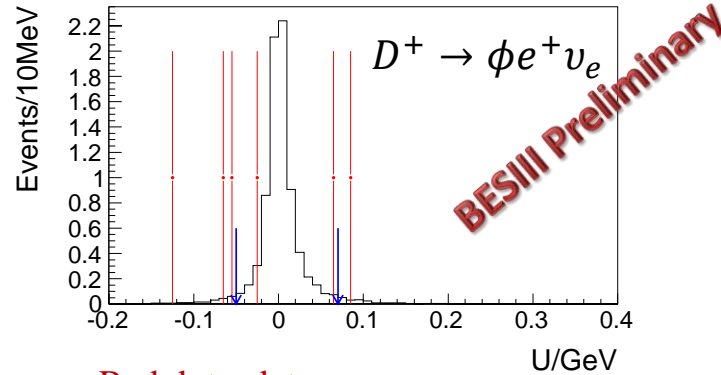

Red dots: data

Black line: fit result

Blue area: total background

Green area: peaking background

Red dots: data

Black histogram: signal MC simulation

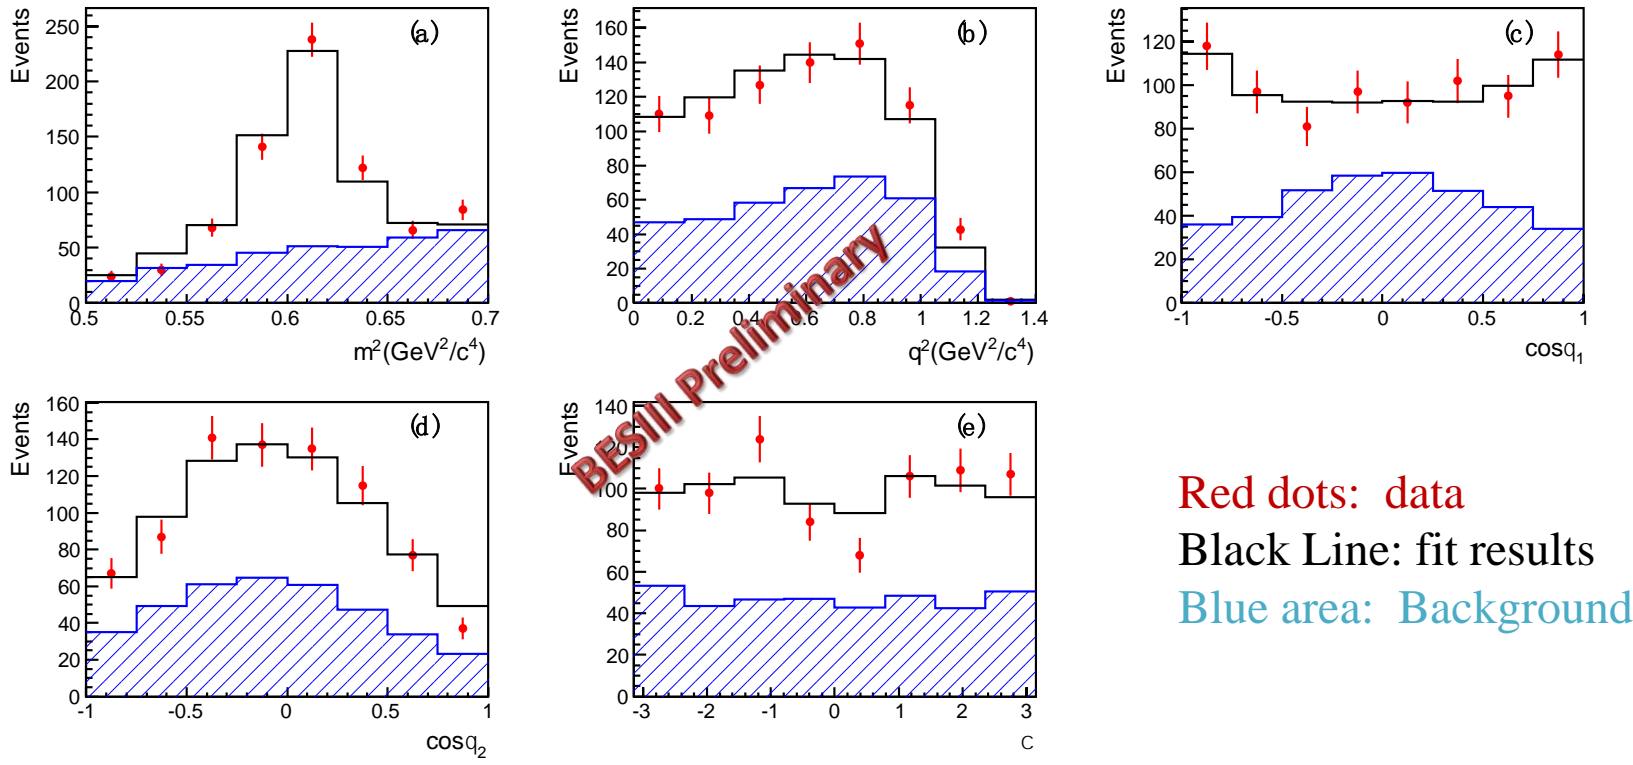

Arrows: signal region

- Branching fractions are compared with the world average value [citation: Particle Data Group, Chin. Phys. C, 527 38, 090001 (2014)].

Mode	This work	Previous
$\omega e^+ \nu_e$	$(1.63 \pm 0.11 \pm 0.08) \times 10^{-3}$	$(1.82 \pm 0.18 \pm 0.07) \times 10^{-3}$
$\phi e^+ \nu_e$	$< 1.3 \times 10^{-5}$ (@90% <i>C.L.</i> )	$< 9.0 \times 10^{-5}$ (@90% <i>C.L.</i> )

# Form Factors in $D^+ \rightarrow \omega e^+ \nu_e$

Form factors for  $D^+ \rightarrow \omega e^+ \nu_e$  decay can be parameterized similarly as in the  $D^+ \rightarrow K^- \pi^+ e^+ \nu_e$  decay. The projections and the form factor parameters are shown below:

Red dots: data  
 Black Line: fit results  
 Blue area: Background

$$r_V = V(0)/A_1(0) = 1.24 \pm 0.09 \pm 0.06$$

$$r_2 = A_2(0)/A_1(0) = 1.06 \pm 0.15 \pm 0.05$$

# Study of $D^+ \rightarrow K_L e^+ \nu_e$ (first measurement)

- **Branching fraction** of  $D^+ \rightarrow K_L e^+ \nu_e$  has never been measured before
- $K^0 - \bar{K}^0$  mixing is expected to give rise to **CP asymmetry** with magnitude of about  $-3.3 \times 10^{-3}$  in  $D^+ \rightarrow K_L e^+ \nu_e$  decay [citation: Z.Z.Xing, Phys. Lett. B 353(1995)31; 363 (1995) 266]
- The differential decay width of  $D^+ \rightarrow K_L e^+ \nu_e$  can be parameterized based on **the transition form factor  $f_+^K(q^2)$**  and the **CKM matrix element  $|V_{cs}|$** :

$$\frac{d\Gamma(D \rightarrow P e \nu)}{dq^2} = X \frac{G_F^2 |V_{cs(d)}|^2 P_{K(\pi)}^3 |f_+(q^2)|^2}{24\pi^3}$$

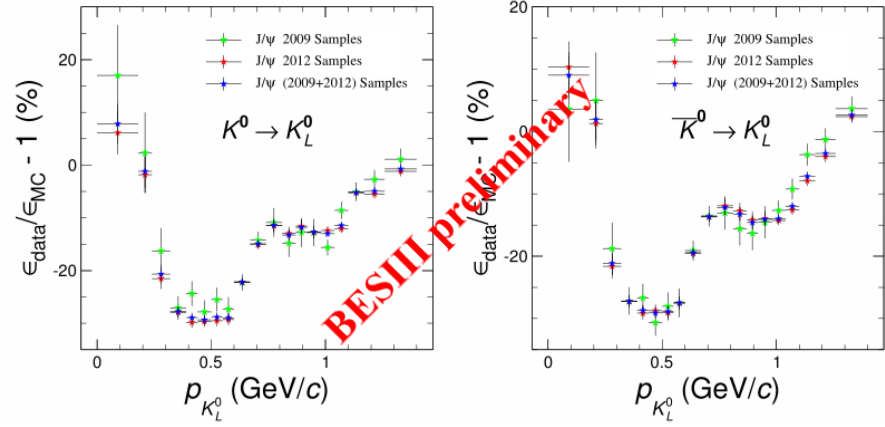

**For  $P = K$  case,  $X = 1$**

- Experimental study of  $D^+ \rightarrow K_L e^+ \nu_e$  is important to test the theoretical prediction of  $A_{CP}^{D^+ \rightarrow K_L e^+ \nu_e}$ , the LQCD calculation on  $f_+^K(0)$  and the unitarity of the CKM matrix.

# Branching Fraction and $A_{CP}^{D^+ \rightarrow K_L e^+ \nu_e}$

- $K_L$  reconstruction:

- The direction of  $K_L$  momentum can be determined from the induced shower in EMC.
- $K_L$  momentum can be inferred by constraining the neutrino  $U = 0$  (for  $U$  definition see page 12).
- Because nuclear interaction is different for  $K^0$  and  $\bar{K}^0$ , and  $K^0 - \bar{K}^0$  coherent oscillation is not considered in simulation, reconstruction efficiencies are corrected separately for  $K_L$  from  $K^0$  and  $\bar{K}^0$

- Branching fraction:

- Signal yields are obtained by fitting  $m_{BC}$  of the tag side (see next page).
- In this analysis, branching fraction is calculated separately for each charm and tag mode using:
- CP asymmetry is determined using:

$$\mathcal{B}_{\text{sig}} = \frac{N_{\text{DT}}(1 - f_{\text{bkg}}^{\text{peak}})}{\epsilon N_{\text{ST}}}$$

$$A_{CP} \equiv \frac{\mathcal{B}(D^+ \rightarrow K_L^0 e^+ \nu_e) - \mathcal{B}(D^- \rightarrow K_L^0 e^- \bar{\nu}_e)}{\mathcal{B}(D^+ \rightarrow K_L^0 e^+ \nu_e) + \mathcal{B}(D^- \rightarrow K_L^0 e^- \bar{\nu}_e)}$$

$D^+ \rightarrow K_L^0 e^+ \nu_e$					
Tag Mode	$N_{\text{ST}}$	$N_{\text{DT}}$	$f_{\text{bkg}}^{\text{peak}}(\%)$	$\epsilon(\%)$	$\mathcal{B}_{\text{sig}}(\%)$
$D^- \rightarrow K^+ \pi^- \pi^-$	$410200 \pm 670$	$10492 \pm 103$	$41.83 \pm 0.28$	$33.96 \pm 0.10$	$4.381 \pm 0.050$

# Branching Fraction and $A_{CP}^{D^+ \rightarrow K_L e^+ \nu_e}$

The fraction of peaking backgrounds are estimated by MC.

Black dots: data;

Blue: Fit result;

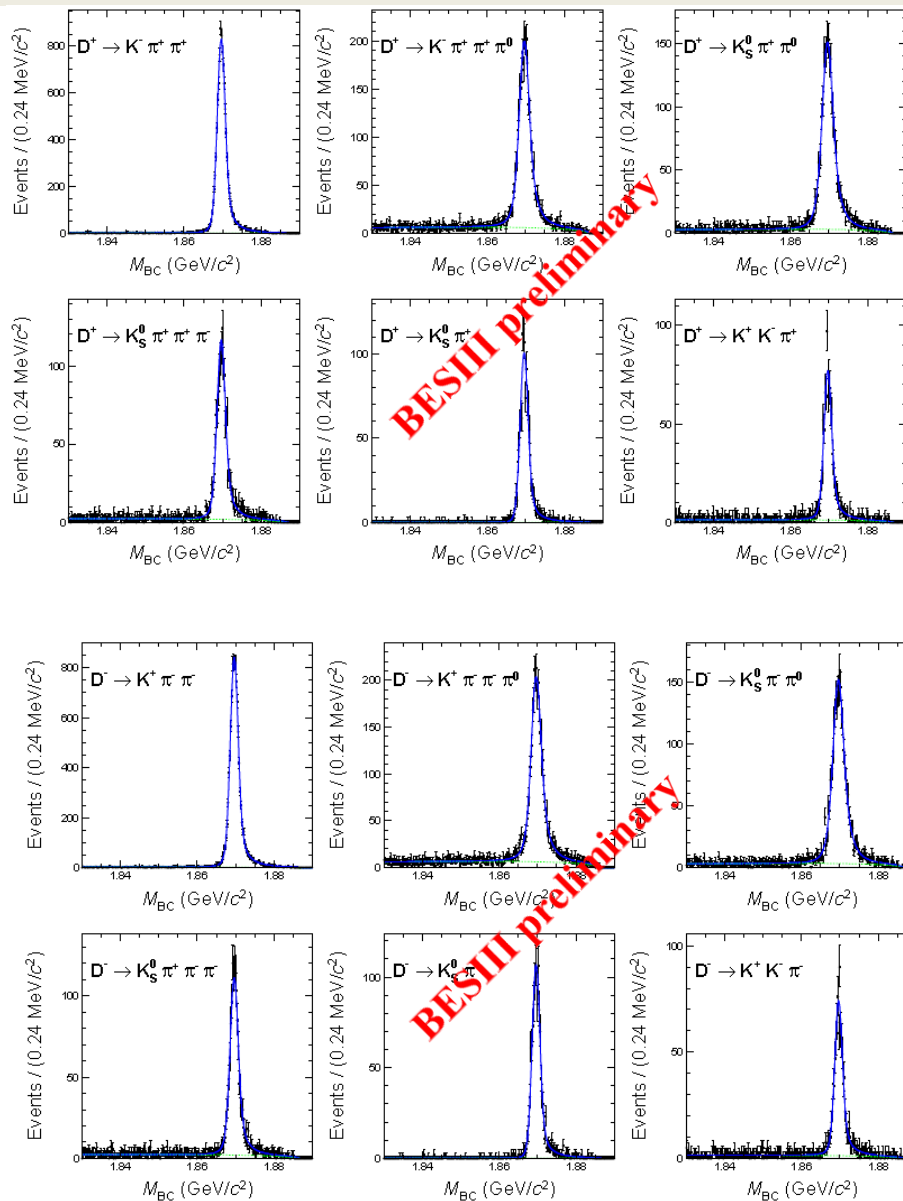

Green Line: combinatorial background

Branching fraction:

$$\bar{B}(D^+ \rightarrow K_L e^+ \nu_e) = (4.482 \pm 0.027 \pm 0.103)\%$$

CP asymmetry:

$$A_{CP}^{D^+ \rightarrow K_L e^+ \nu_e} = (-0.59 \pm 0.60 \pm 1.50)\%$$

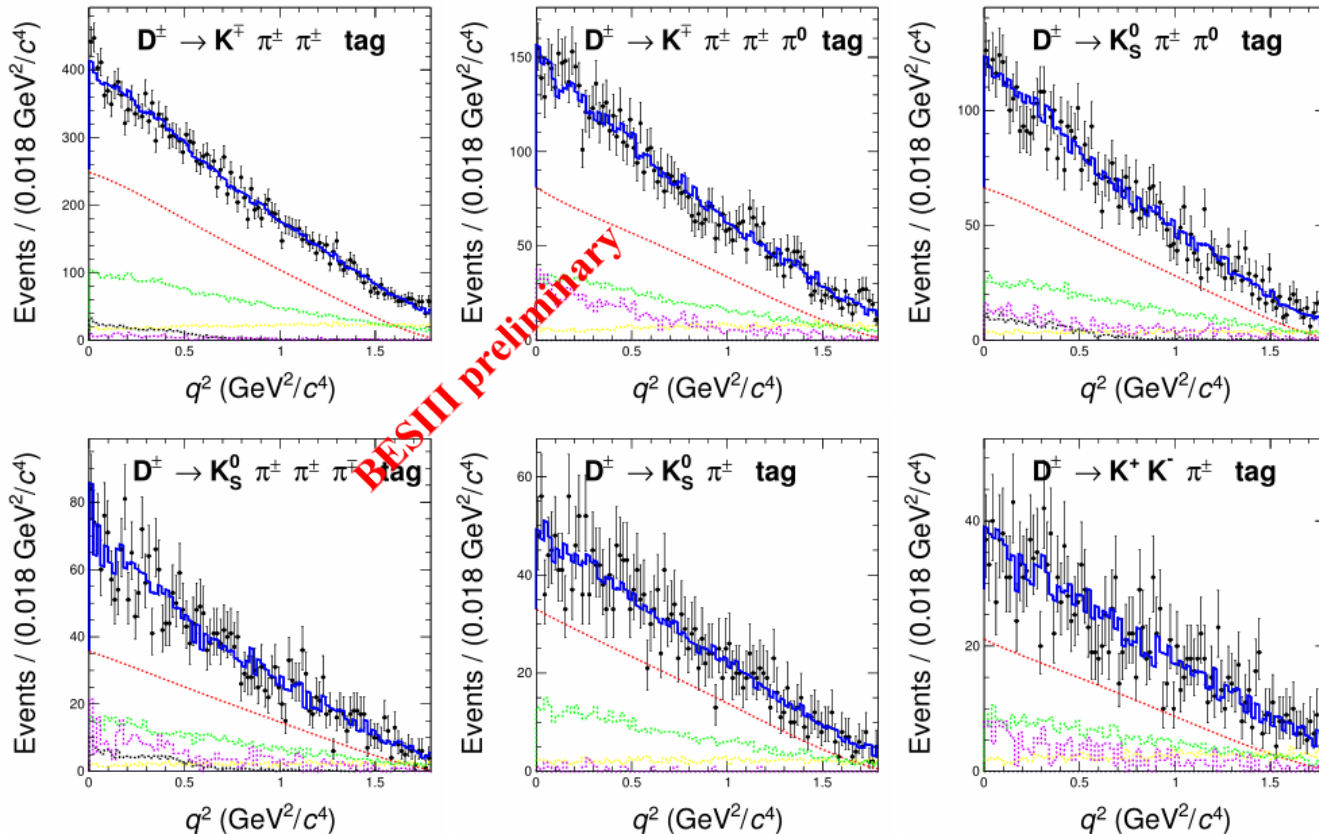

# Form Factor measurement

Signal shape of  $q^2$  distribution can be described using  $\frac{dn_{\text{observed}}}{dq^2} = AN_{\text{tag}}p^3(q'^2)|f_+(q'^2)|^2\epsilon(q'^2) \otimes \sigma(q'^2, q^2)$

2-par. Series Expansion is performed for form factor  $f_+(q^2)$ :  $f_+(q^2) = \frac{1}{P(q^2)\phi(q^2, t_0)} \sum_{k=0}^{\infty} a_k(t_0) [z(q^2, t_0)]^k$   
 [cite: Becher and Hill, Phys. Lett. B 633, 61 (2006)]

Simultaneous fits are performed:

$$f_+^K(0)|V_{cs}| = 0.728 \pm 0.006 \pm 0.011, \quad r_1 \equiv a_1/a_0 = 1.91 \pm 0.33 \pm 0.24$$

# Summary

- In the study of  $D^+ \rightarrow K^- \pi^+ e^+ \nu_e$ :
  - Branching fractions are measured:  
 $\text{Br}(D^+ \rightarrow K^- \pi^+ e^+ \nu_e) = (3.71 \pm 0.03 \pm 0.09)\%$   
 $\text{Br}(D^+ \rightarrow K^- \pi^+ e^+ \nu_e)_{[0.8,1]} = (3.33 \pm 0.03 \pm 0.08)\%$
  - Amplitude analysis is applied:
    - Fractions of the  $K\pi$  components are analyzed. S-wave contribution is observed to be  $(6.05 \pm 0.22 \pm 0.18)\%$ .
    - $K^{*0}(892)$  properties and the form factors based on the SPD model are provided.
  - Model-independent measurement of S-wave phase and the  $K^{*0}(892)$  helicity basis form factors are performed. They are generally consistent with previous reports and the amplitude analysis results.
- In the study of  $D^+ \rightarrow \omega(\phi)e^+ \nu_e$ :
  - Branching fractions or upper limits are provided:  
 $\text{Br}(D^+ \rightarrow \omega e^+ \nu_e) = (1.63 \pm 0.11 \pm 0.08) \times 10^{-3}$   
 $\text{Br}(D^+ \rightarrow \phi e^+ \nu_e) < 1.3 \times 10^{-5}$  (@90% C.L.)
  - Form factor parameters in  $D^+ \rightarrow \omega e^+ \nu_e$  are first measured:  
 $r_V = V(0)/A_1(0) = 1.24 \pm 0.09 \pm 0.06$ ;  $r_2 = A_2(0)/A_1(0) = 1.06 \pm 0.15 \pm 0.05$
- In the study of  $D^+ \rightarrow K_L e^+ \nu_e$ :
  - Branching fractions and CP asymmetry are measured:  
 $\bar{B}(D^+ \rightarrow K_L e^+ \nu_e) = (4.482 \pm 0.027 \pm 0.103)\%$ ,  $A_{CP}^{D^+ \rightarrow K_L e^+ \nu_e} = (-0.59 \pm 0.60 \pm 1.50)$
  - Form factor related parameters are also measured:  
 $f_+^K(0)|V_{cs}| = 0.728 \pm 0.006 \pm 0.011$ ,  $r_1 \equiv a_1/a_0 = 1.91 \pm 0.33 \pm 0.24$

Backup

# Estimation of Backgrounds in the Double Tag

By using MC-truth information of the  $K_L$  efficiency corrected  $D\bar{D}$  MC samples, the double-tag  $D$  candidates can be divided into the following categories:

➤ **Signal:** tag-side matched and signal-side matched signal events

➤ **Background:**

- **Bkg I:**  $D\bar{D}$  decays of which hadronic tag  $D$  is mis-reconstructed and non- $D\bar{D}$  processes. Its proportion varies from 1% to 12% according to the specific hadronic tag mode
- **Bkg II:** ( $\sim 10\%$ )  $D^+ \rightarrow K_L e^+ \nu_e$  events of which  $K_L$  shower is mis-reconstructed.
- **Bkg III:**  $D^+ \rightarrow X e \nu_e$  non-signal events ( $\sim 24\%$ ), which are from  $D^+ \rightarrow \bar{K}^*(892)^0 e^+ \nu_e$  (41.9%),  $D^+ \rightarrow K_S e^+ \nu_e$  (41.2%),  $D^+ \rightarrow \pi^0 e^+ \nu_e$  (10.2%),  $D^+ \rightarrow \eta e^+ \nu_e$  (6.0%) and  $D^+ \rightarrow \omega e^+ \nu_e$  (0.7%)
- **Bkg IV:**  $D^+ \rightarrow X \mu \nu_\mu$  events ( $\sim 3\%$ ), consist of  $D^+ \rightarrow K_L \mu^+ \nu_\mu$  (65.2%),  $D^+ \rightarrow \bar{K}^*(892)^0 \mu^+ \nu_\mu$  (23.3%) and  $D^+ \rightarrow K_S \mu^+ \nu_\mu$  (11.5%)
- **Bkg V:** Non-leptonic D decay events ( $\sim 3\%$ ), which are from  $D^+ \rightarrow \bar{K}^0 \pi^+ \pi^0$  (78%) and  $D^+ \rightarrow \bar{K}^0 K^*(892)^+$  (22%)

Composition of double-tag  $D$  candidates

In the determination of  $B(D^+ \rightarrow K_L e^+ \nu_e)$ , the peaking backgrounds consist of Bkg II~Bkg V. This estimation brings in 1.6% systematic uncertainty.
