Light meson spectroscopy at BESIII

X(18??) states:

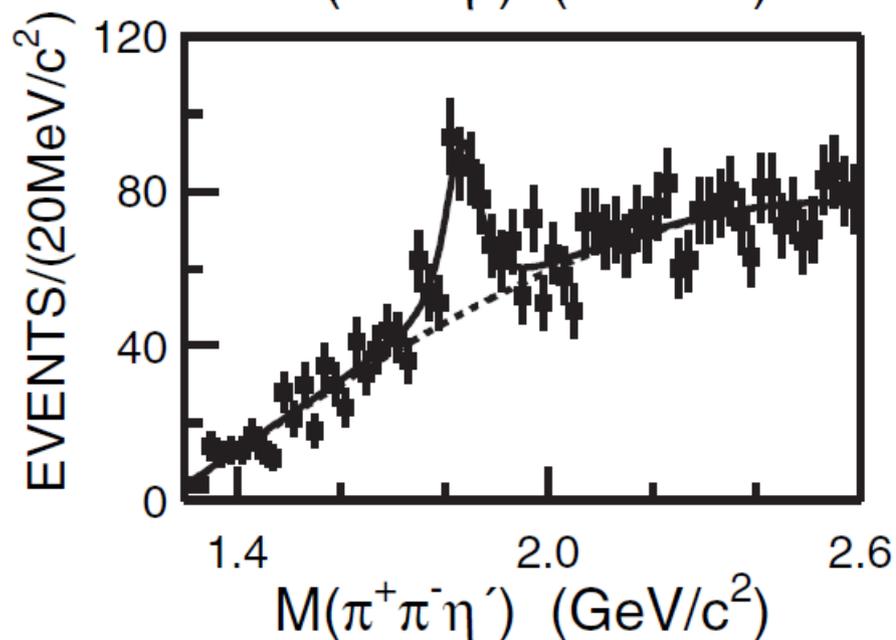

- X(1835) in $J/\psi \rightarrow \gamma \pi^+ \pi^- \eta'$ PRL 106, 072002
- X($\bar{p}p$) in $J/\psi \rightarrow \gamma \bar{p}p$ PRL 108, 112003
- X(1870) in $J/\psi \rightarrow \omega \eta \pi \pi$ PRL 107, 182001
- X(1840) in $J/\psi \rightarrow \gamma 3(\pi^+ \pi^-)$ PRD 88, 091502
- X(1810) in $J/\psi \rightarrow \gamma \omega \phi$ PRD 87, 032008
- $\eta(1405)$ in $J/\psi \rightarrow \gamma 3\pi, (\omega, \phi) \eta \pi \pi$ PRL 108, 182001; PRD 91, 052017
- $\Upsilon(2175)$ in $J/\psi \rightarrow \phi \eta \pi \pi$
- PWA of $J/\psi \rightarrow \gamma \eta \eta$ PRD 87, 092009

Based on 225 M J/ψ data (now 1.31 M J/ψ)

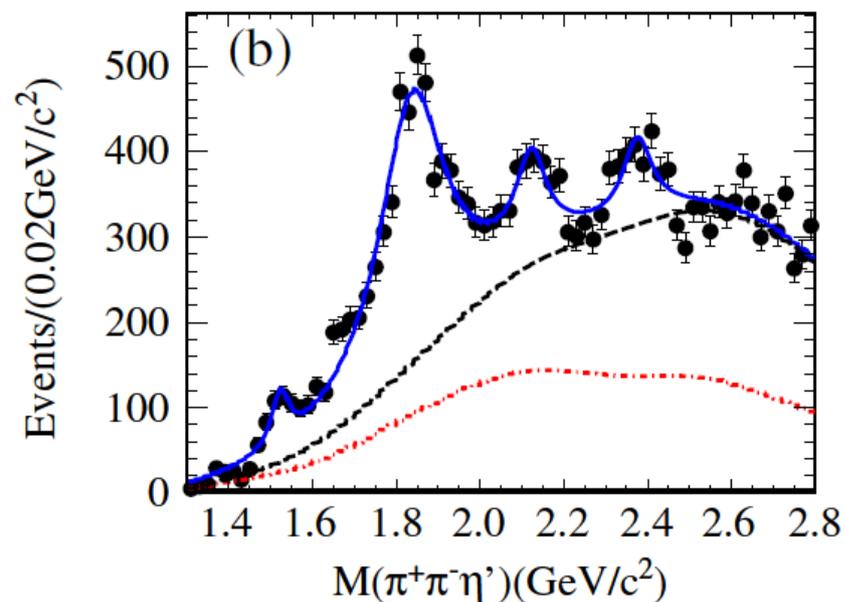

X(1835)

First observed in decay to $\pi^+\pi^-\eta'$ in
 $J/\psi \rightarrow \gamma\pi^+\pi^-\eta'$ (BESII PRL95 (2005) 262001)

BESIII PRL106 (2011) 072002

$$M = 1836.5 \pm 3.0(\text{stat})_{-2.1}^{+5.6}(\text{syst}) \text{ MeV}/c^2$$

$$\Gamma = 190 \pm 9(\text{stat})_{-36}^{+38}(\text{syst}) \text{ MeV}/c^2$$

Possible interpretations

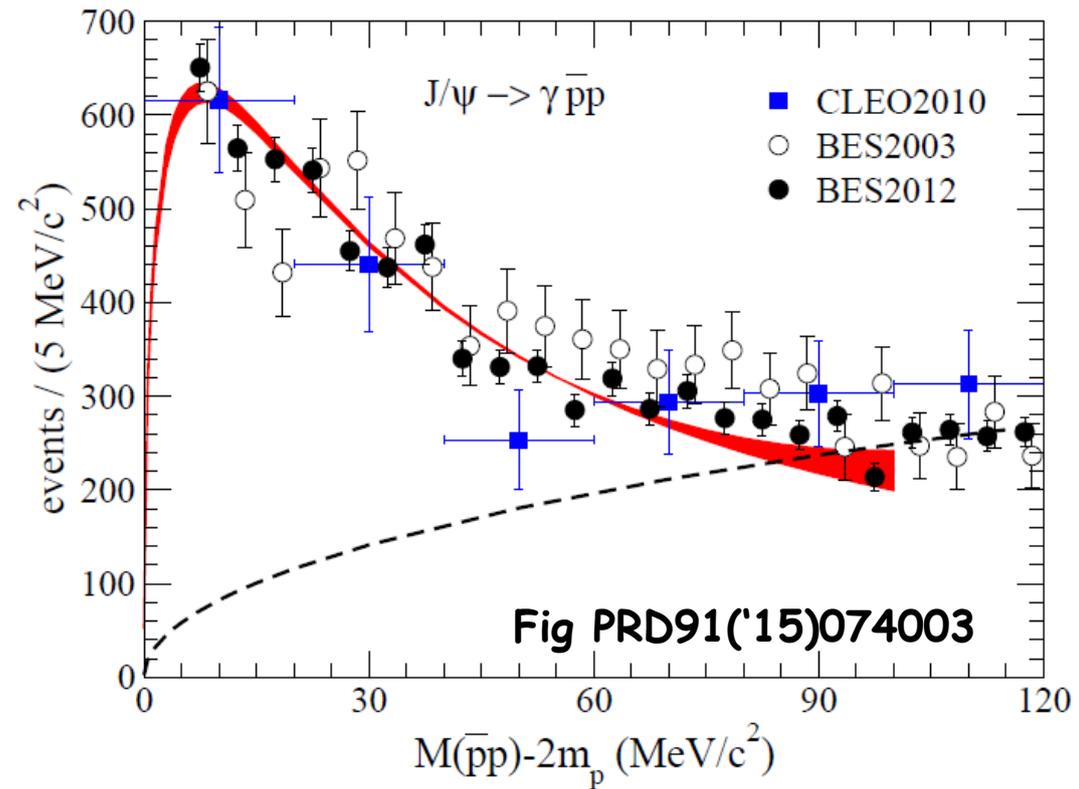

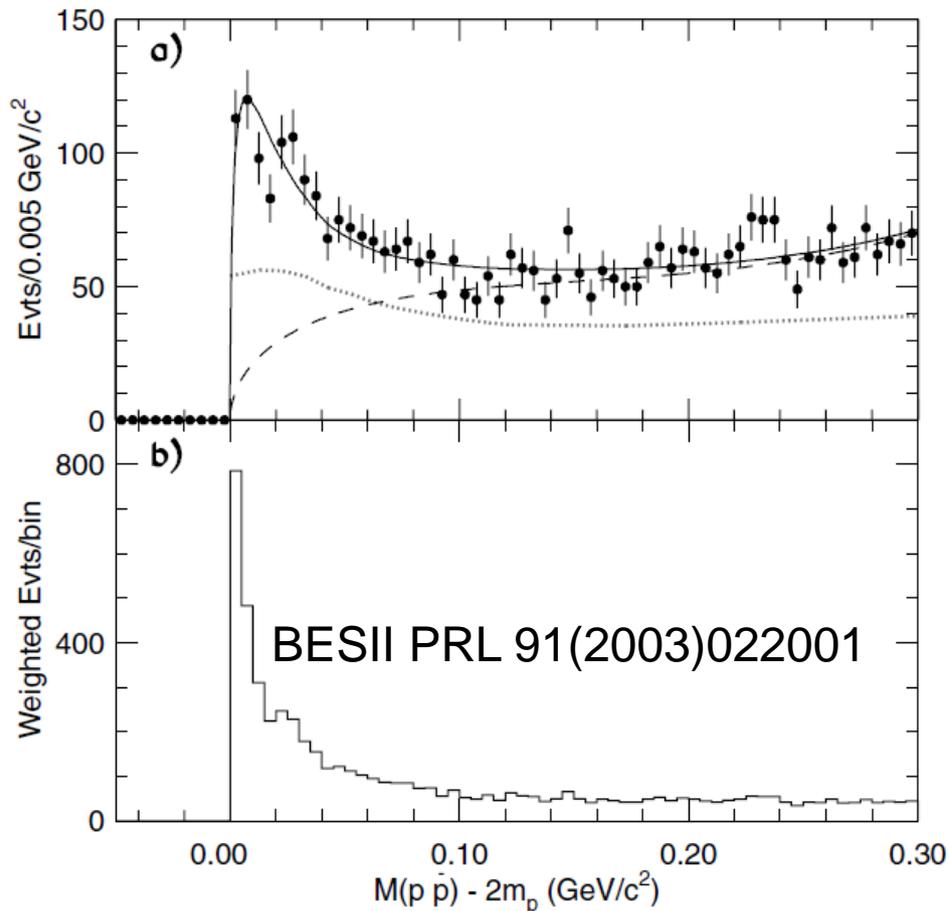

- $\bar{p}p$ bound state
- a second radial excitation of the η'
- pseudo-scalar glueball

Relation to $X(\bar{p}p)$ enhancement,

$X(\bar{p}p)$

Observed by BESII in the decay $J/\psi \rightarrow \gamma \bar{p}p$

(confirmed by BESIII and CLEO).

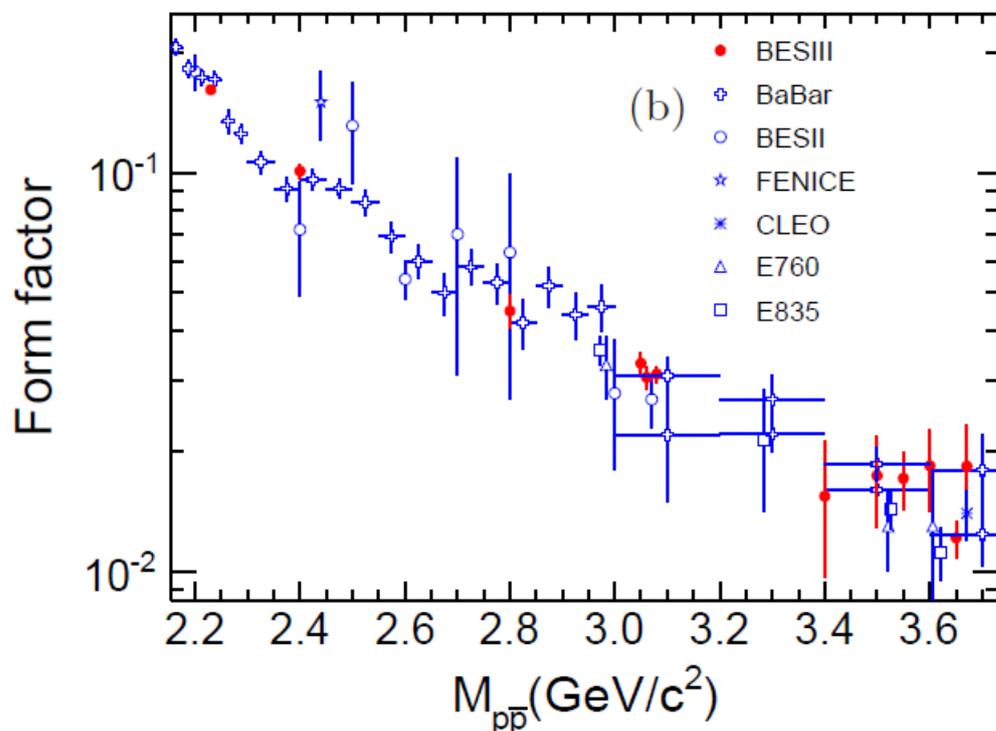

Spin-parity analysis of $J/\psi \rightarrow \gamma \bar{p}p$
performed by BESIII and the $J^{PC} = 0^{+-}$.
 pp FSI ?

Studies of other channels BESIII:
 $\Psi' \rightarrow \gamma \bar{p}p$, $J/\Psi \rightarrow \pi \bar{p}p$,
 $J/\Psi \rightarrow \eta \bar{p}p$, $J/\Psi \rightarrow \omega \bar{p}p$

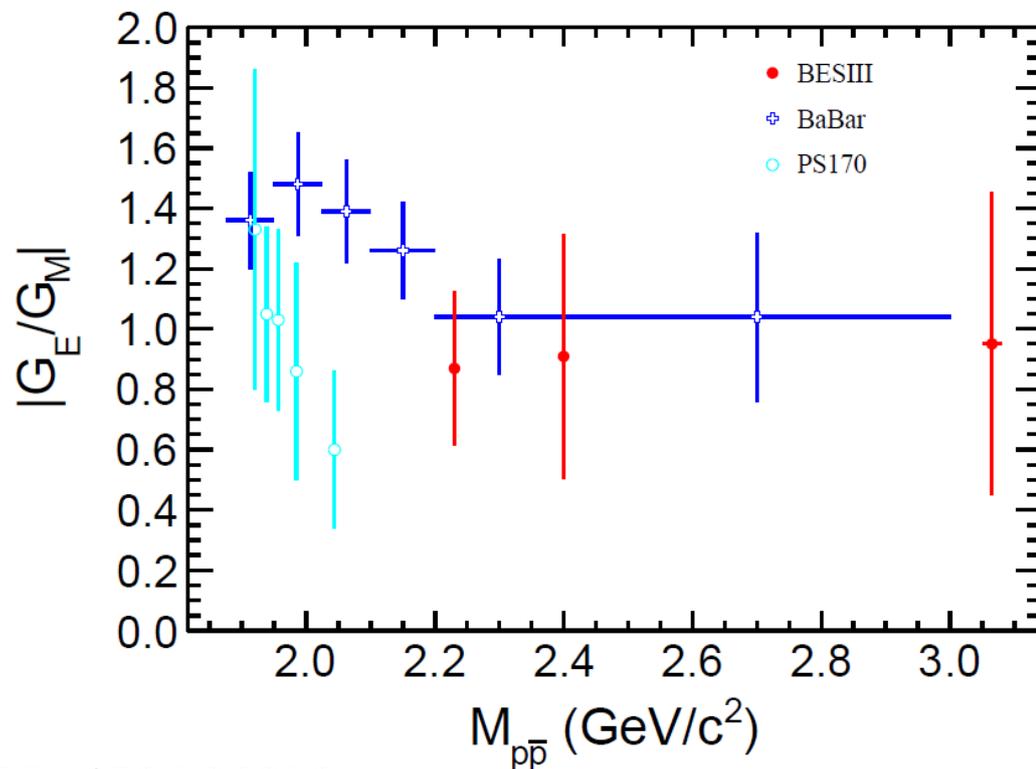

Baryon spectroscopy at BESIII

- PWA of $\psi(3686) \rightarrow \bar{p}p\pi^0$ PRL 110, 022001
- PWA of $\psi(3686) \rightarrow \bar{p}p\eta$ PRD 88, 032010
- Measurement of $\psi(3686) \rightarrow \gamma K^-\Lambda \Xi^+ + c. c.$ arXiv:1504.02025
- Observation of $\psi(3686) \rightarrow \Lambda \Sigma^1 \pm \pi^\mp + c. c.$ PRD 88, 112007

Based on 106 M $\psi(3686)$ data

$e^+e^- \rightarrow p\bar{p}$

arXiv:1504.02680

Amplitude analysis of $\pi^0\pi^0$ system

The light scalar meson spectrum ($J^{PC} = 0^{++}$):

Broad, overlapping states

Lightest glueball state

J/ψ radiative decay to $\pi^0\pi^0$ provides a clean environment to study this spectrum

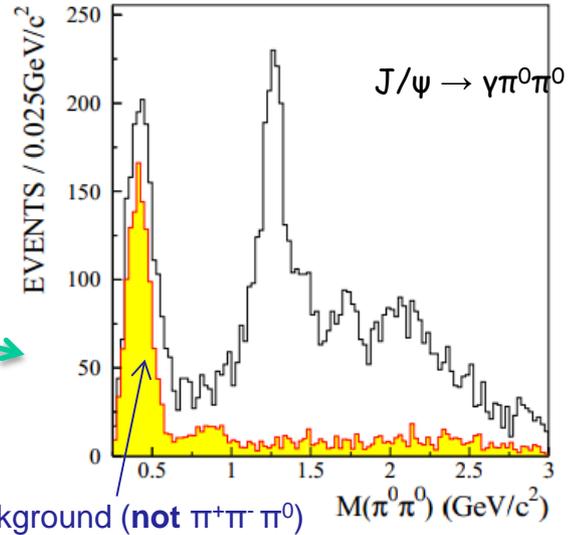

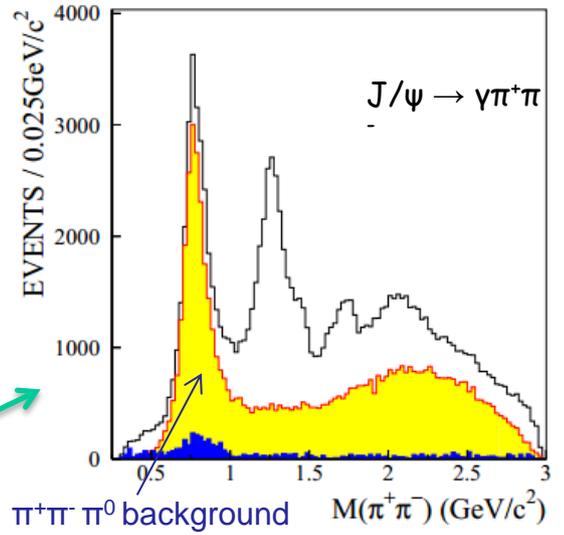

Radiative decays to two pseudoscalars, angular momentum + parity restricts the quantum numbers to $J^{PC}=0^{++}, 2^{++}, 4^{++} \dots$

Neutral channel is cleaner than the charged channel

Amplitude analysis:

Mass independent fits \rightarrow final state interactions of $\pi^0\pi^0$

Mass dependent fits \rightarrow extracting masses, widths, etc. of intermediate states

Event Selection

Initial selection criteria:

No charged tracks

five good photons

25 (50) MeV in the barrel (endcap)

No timing requirement

Perform 6C kinematic fit

If multiple combinations of $\gamma\pi^0\pi^0$,
keep event with smallest χ^2

Additional selection criteria:

6C kinematic fit χ^2

$\chi^2 < 20$ for low mass region ($< 0.99 \text{ GeV}/c^2$)

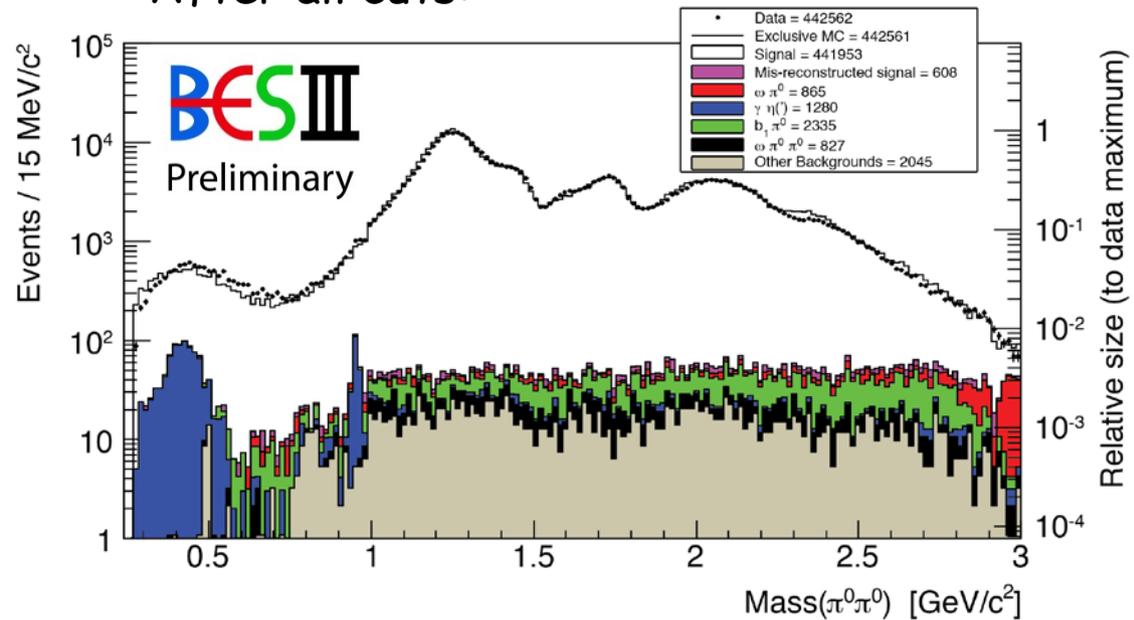

$\chi^2 < 100$ for high mass region ($\geq 0.99 \text{ GeV}/c^2$)

$|M(\gamma\pi^0) - M(\omega)| > 50 \text{ MeV}/c^2$

The invariant mass of the radiative photon
paired with any π^0 daughter photon must
be greater than $150 \text{ MeV}/c^2$

Analysis done at Indiana U
(in coll with JPAC)

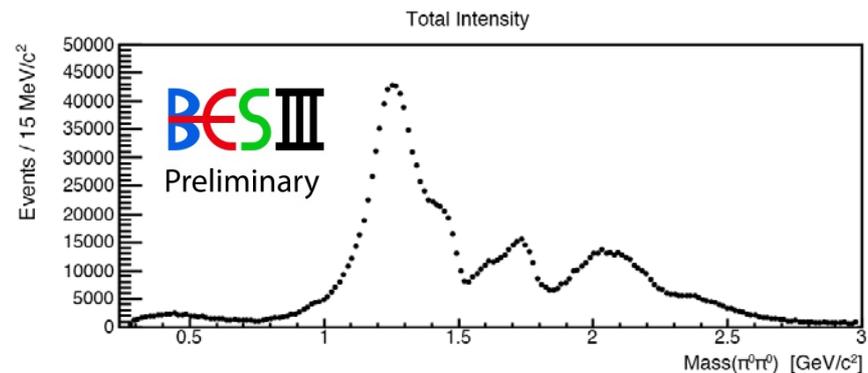

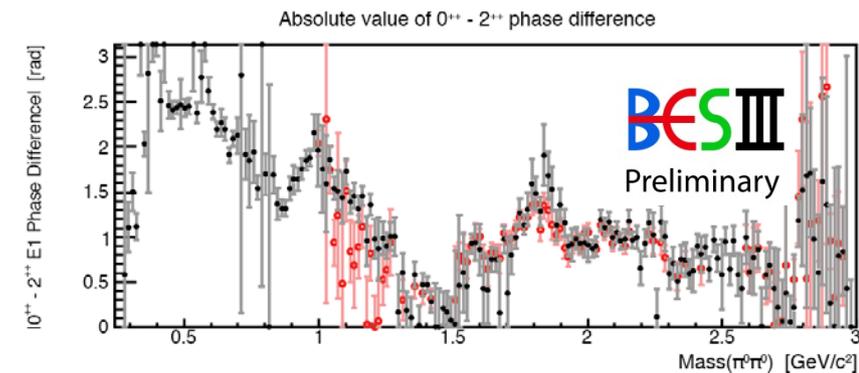

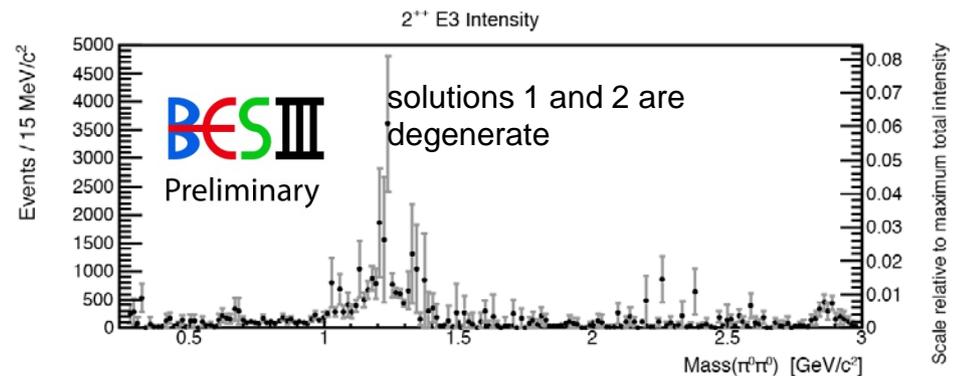

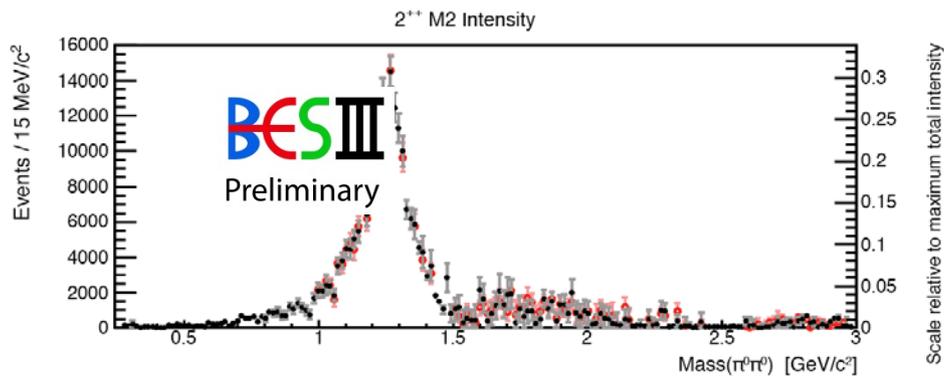

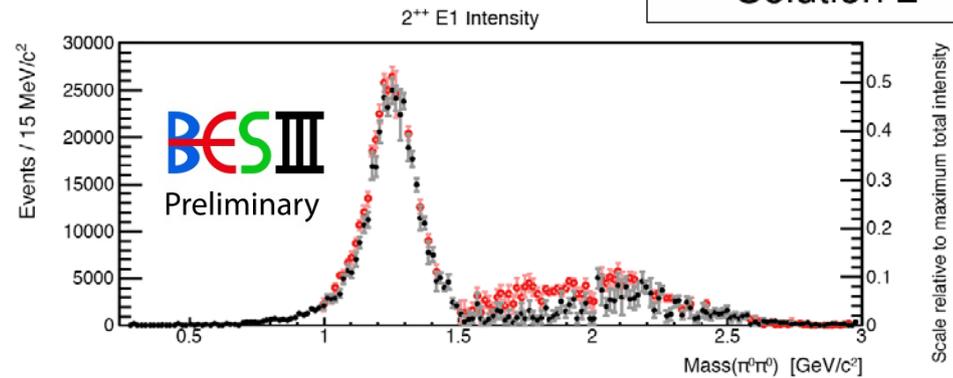

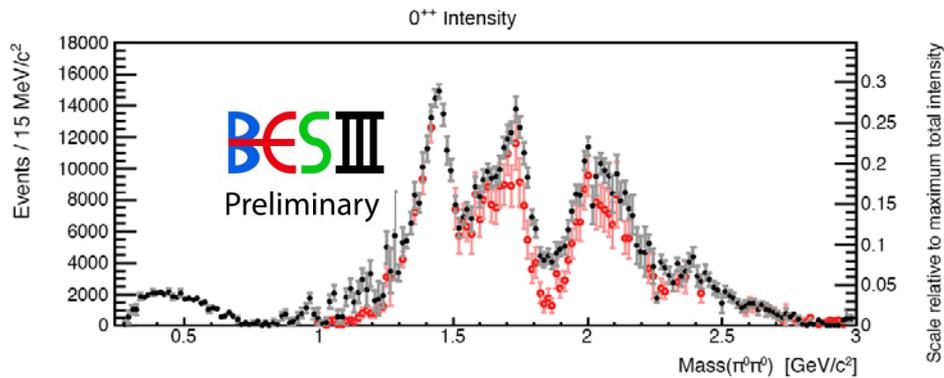

After all cuts:

Decay channel	Number of events
$J/\psi \rightarrow \gamma\pi^0\pi^0$ (data)	475,722
$J/\psi \rightarrow \gamma\pi^0\pi^0$ (MC)	789,801
$J/\psi \rightarrow \gamma\pi^0\pi^0$ (continuum)	277
$J/\psi \rightarrow b_1\pi^0; b_1 \rightarrow \gamma\pi^0$	3,174
$J/\psi \rightarrow \omega\pi^0; \omega \rightarrow \gamma\pi^0$	1,067
$J/\psi \rightarrow \gamma\eta; \eta \rightarrow 3\pi^0$	877
$J/\psi \rightarrow \gamma\eta'; \eta' \rightarrow \eta\pi^0\pi^0; \eta \rightarrow \gamma\gamma$	586
Misreconstructed signal events	2,428
Other backgrounds	6,005
Total Background (MC)	14,141

Results

- Solution 1
- Solution 2
- Solution 2

Conclusions

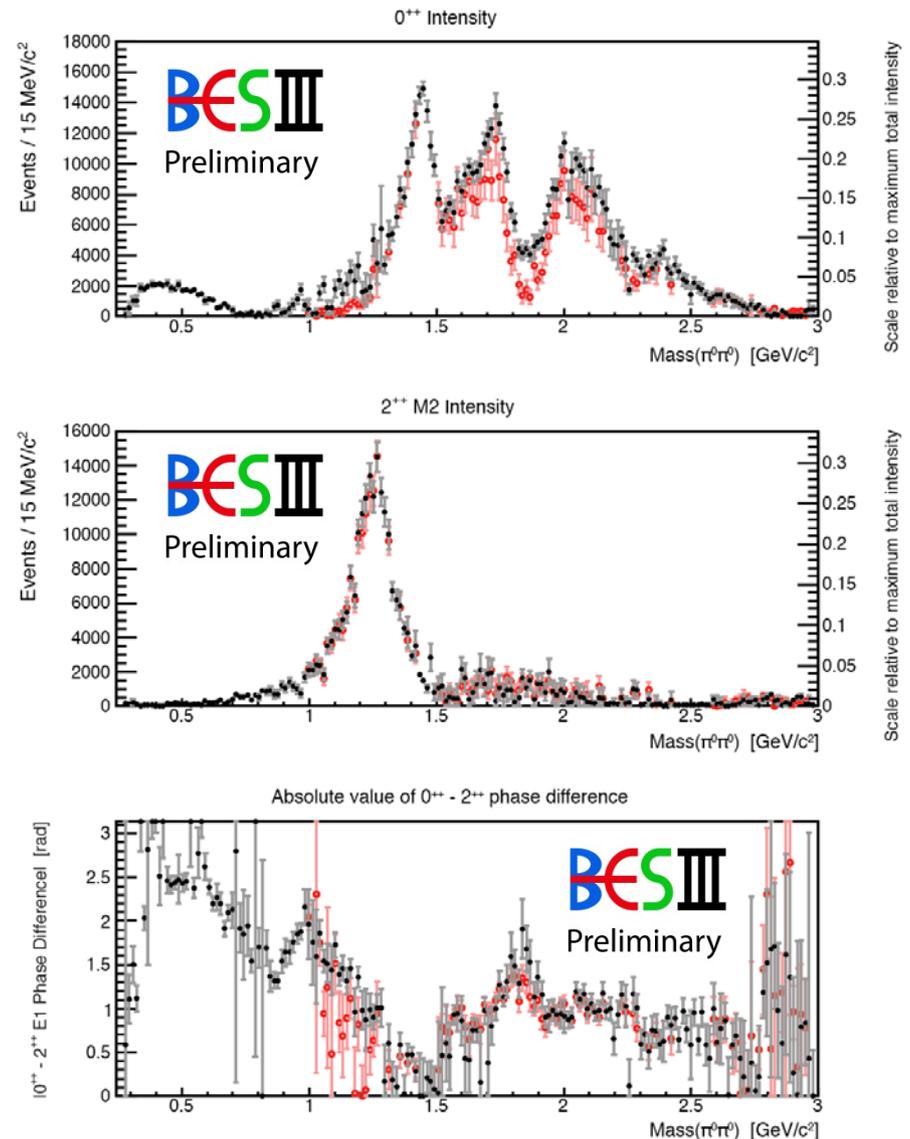

- Solution 1
- Solution 2

A mass independent amplitude analysis is performed

Goal: *Extract the function that describes the dynamics of the $\pi\pi$ interaction*

These results may be integrated with other, related data and fit by any arbitrary model, allowing for studies of $\pi\pi$ dynamics

Significant features of the scalar spectrum include structures near 1.5, 1.7, and 2.0 GeV/c^2

* Error bars are statistical only

Published η/η' results from BESIII:

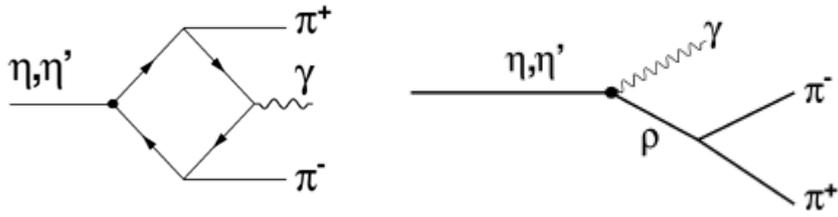

- * $\eta' \rightarrow \pi^+\pi^-\eta$ DP PRD83, 012003('11)
- * $\eta/\eta' \rightarrow \pi^+\pi^-, \pi^0\pi^0$ CPV UL PRD84, 032006('11)
- * $\eta' \rightarrow \pi^+\pi^-\pi^0, \pi^0\pi^0\pi^0$ BR PRL108, 182001('12)
- * $\eta' \rightarrow \pi^+\pi^-l+l-$ BR PRD87, 092001('13)
- * invisible decays UL PRD87, 012009('13)
- * weak decays UL PRD87, 032006('13)
- $\eta' \rightarrow 4\pi$ BR PRL112, 251801('14)

* These results are based on 226 J/ Ψ

1.31×10^9 J/ Ψ events \rightarrow ca 6×10^6 η'

$\eta/\eta' \rightarrow \pi^+\pi^-\gamma$

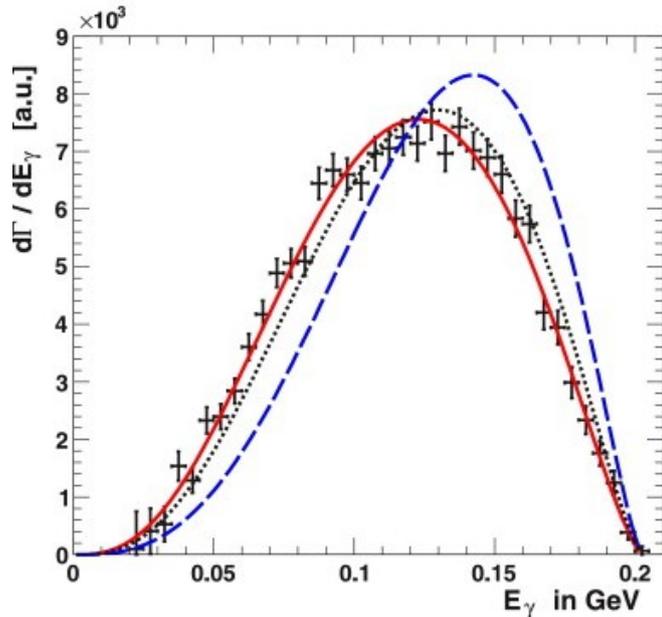

$$\frac{d\Gamma_{\eta(\eta')}}{ds_{\pi\pi}} \propto \left| C + \frac{1}{s_{\pi\pi} - m_\rho^2 - im_\rho\Gamma_\rho} \right|^2$$

$$\frac{d\Gamma}{ds} = |A(1 + \alpha s + \dots)F_V(s)|^2 K_P(s)$$

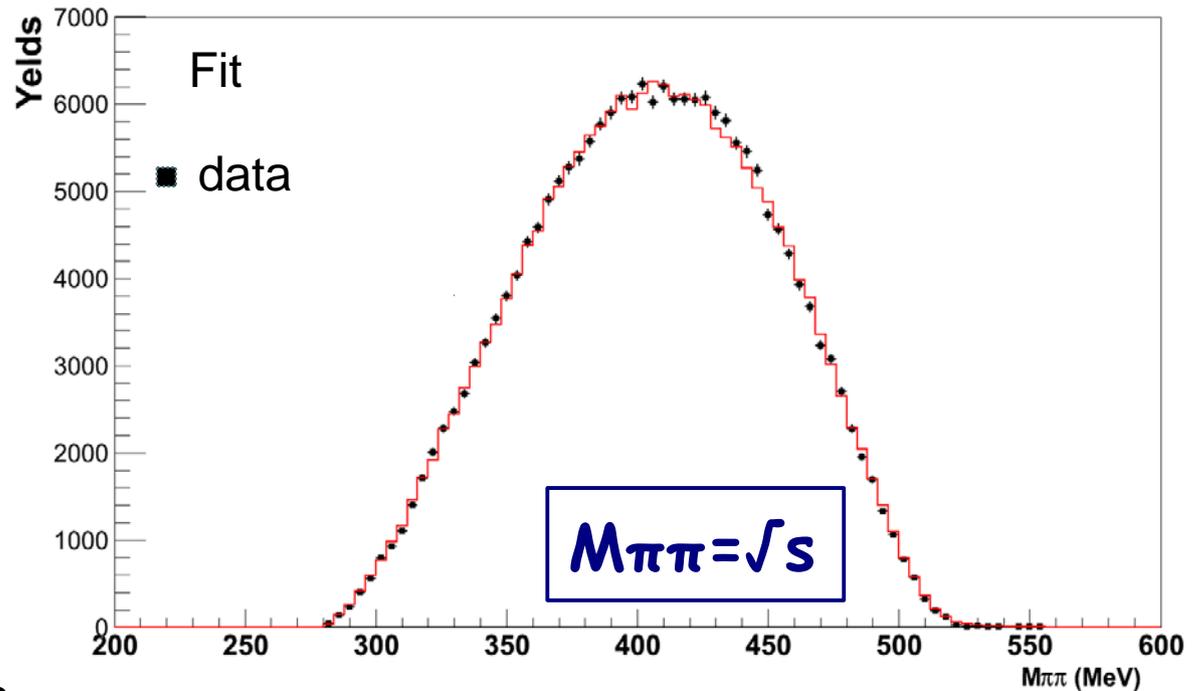

PLB707 (2012) 184

$e^+e^- \rightarrow \pi^+\pi^-$

$$\alpha = 1.89 \pm 0.25_{\text{stat}} \pm 0.59_{\text{syst}} \text{ GeV}^{-2}$$

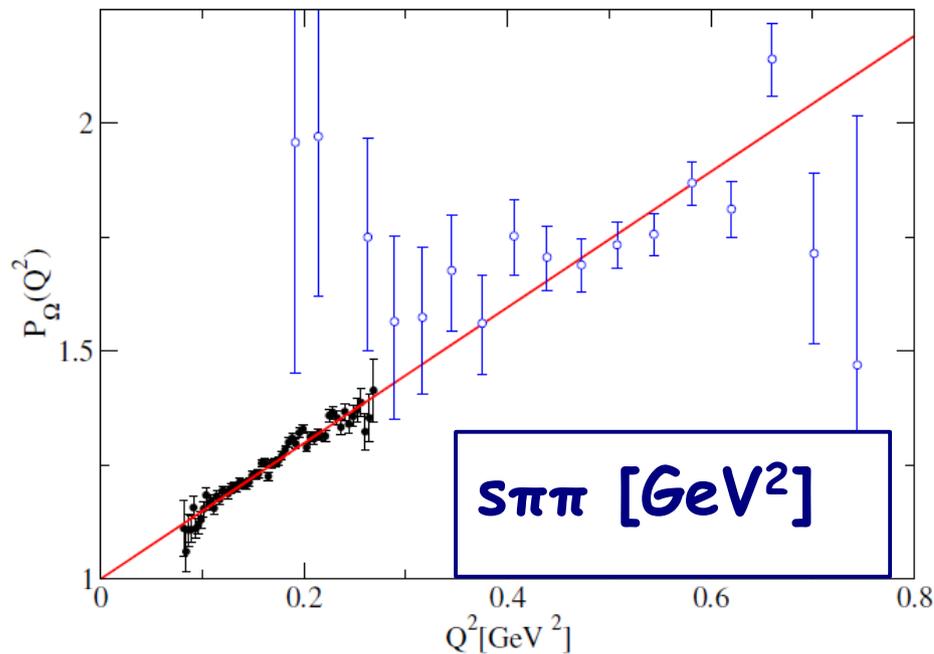

[WASA PLB707 (2012) 243]

$$\alpha = 1.31 \pm 0.08_{\text{stat}} \pm 0.40_{\text{syst}} \text{ GeV}^{-2}$$

[KLOE PLB718 (2013) 910]

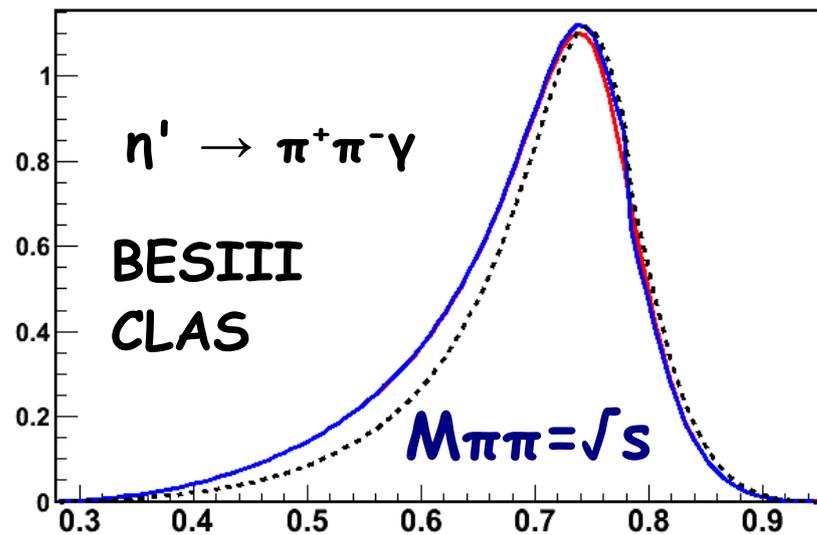

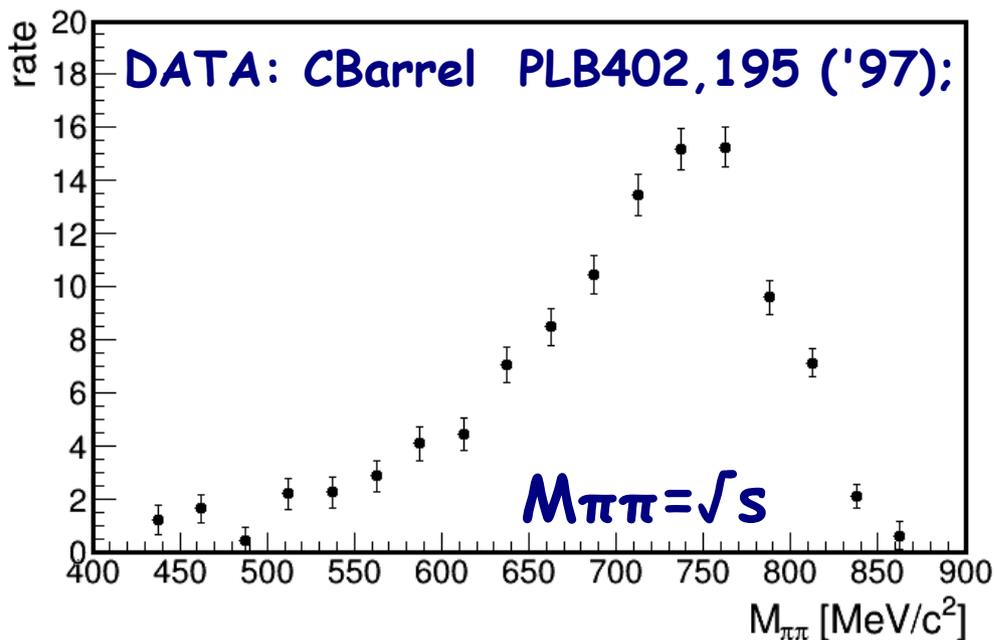

$\eta' \rightarrow \pi^+\pi^-\gamma$

$$P(s_{\pi\pi}) = A_0(1 + \alpha s_{\pi\pi})$$

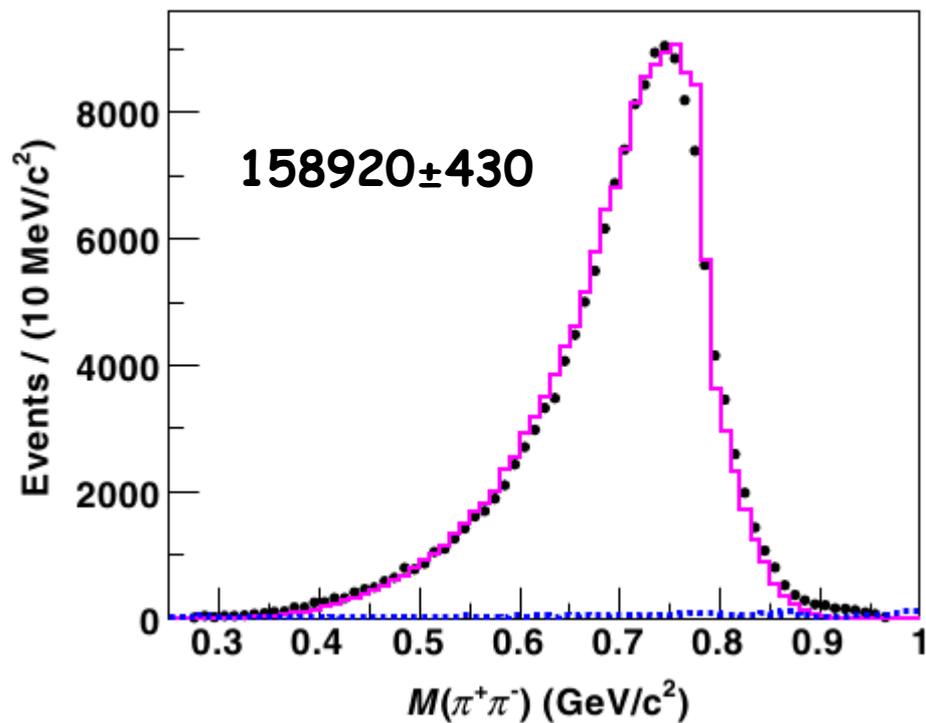

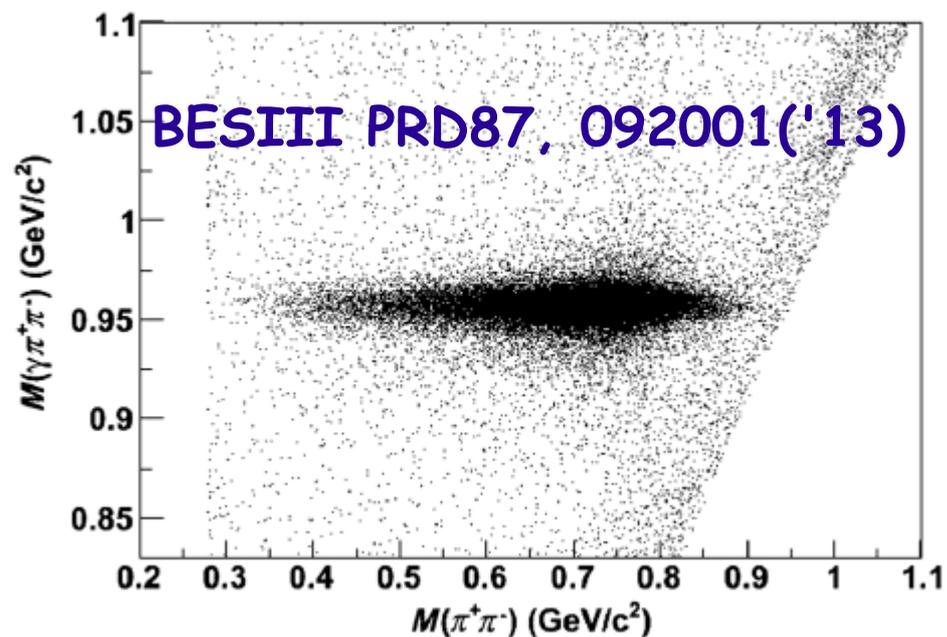

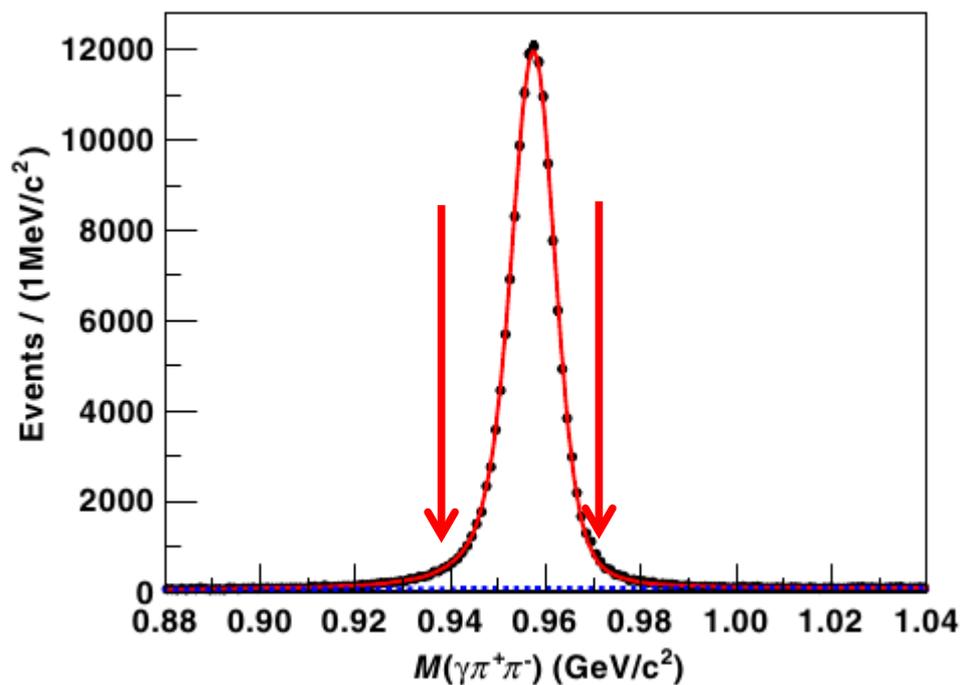

→ α reaction specific

→ $\alpha[\eta] = \alpha[\eta']$ understood
1-loop ChPT + large N_c

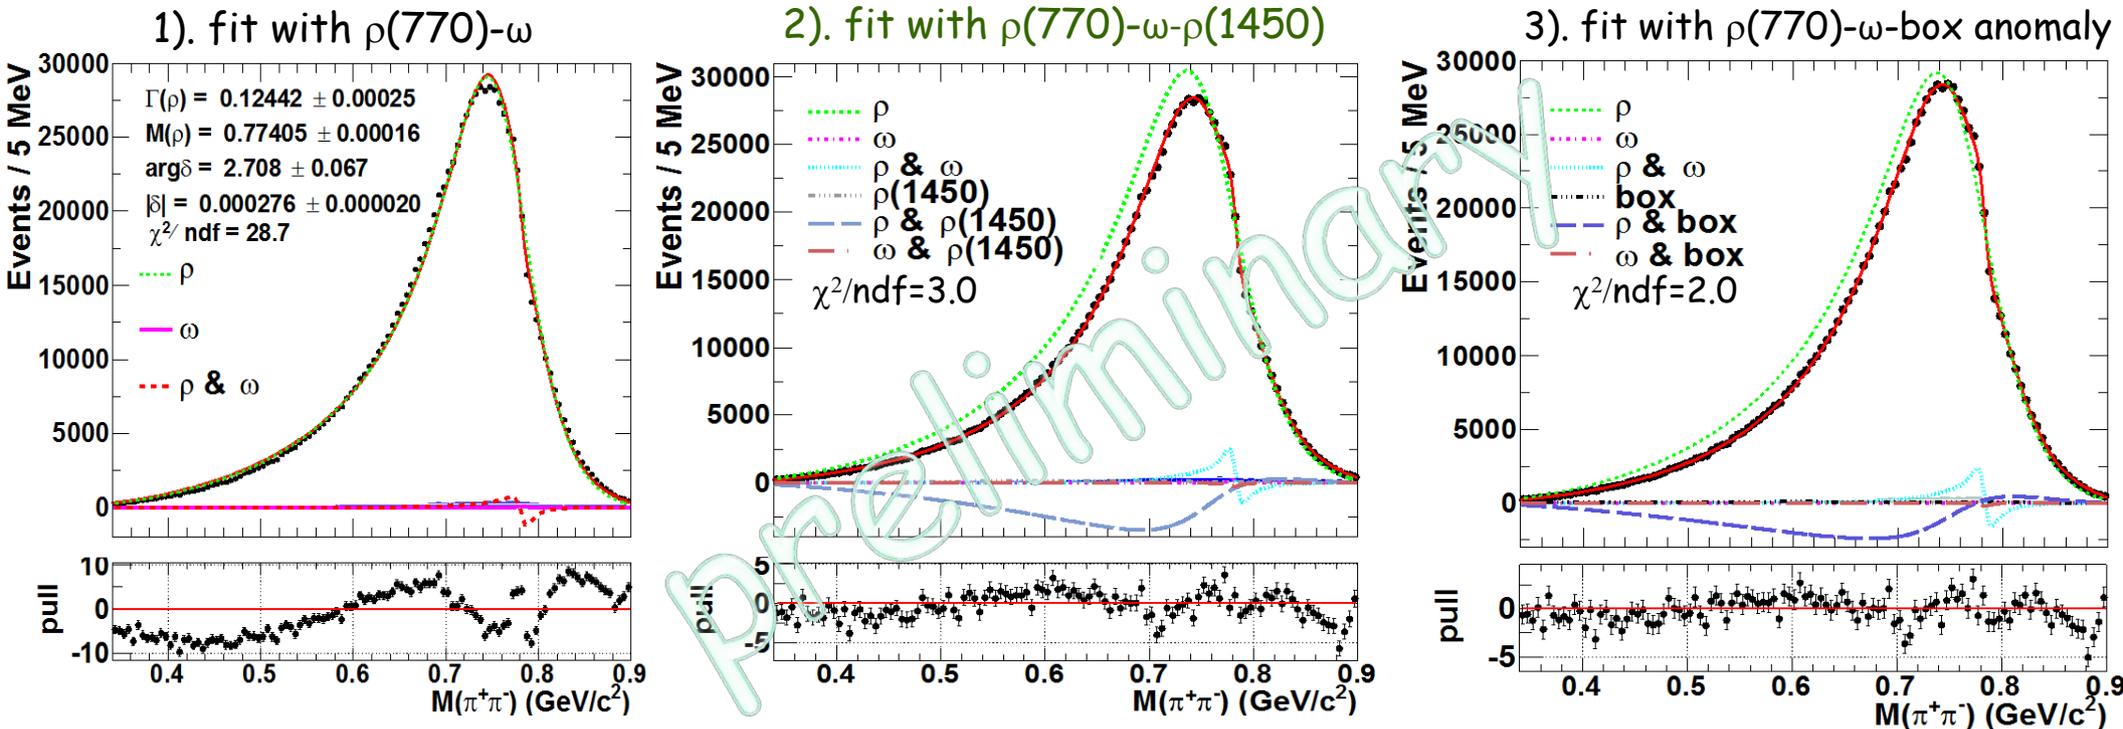

KLOE PL B718, 910 ('13)

BESIII data sample on $\eta' \rightarrow \pi^+\pi^-\gamma$

Now $1.9 \times 10^6 \eta \rightarrow \pi^+\pi^-\gamma$

Model-dependent fit

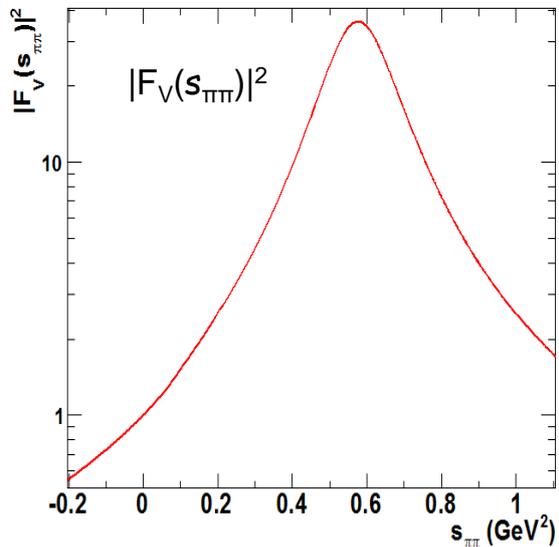

$$\frac{d\Gamma}{dm} \propto k_\gamma^3 q_\pi^3(m) \left| \frac{BW_\rho^{GS} (1 + \delta \frac{m^2}{m_\rho^2} BW_\omega) + \beta \cdot BW_{\rho'}^{GS}}{1 + \beta} + \frac{E_{\eta'}}{F_{\eta'}} \right|^2$$

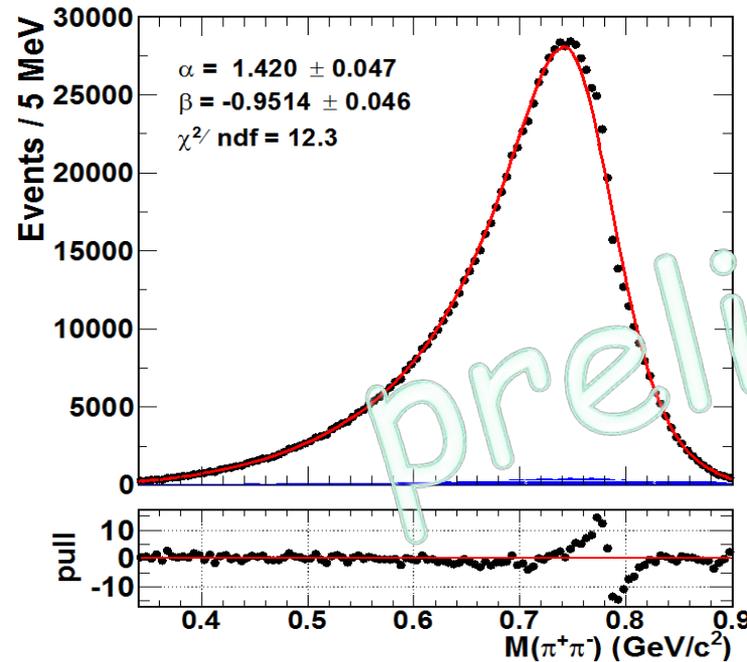

- ✓ Beside $\rho(770)$ resonance, ω is needed
- ✓ $\rho(770)$ - ω is not enough;
- ✓ Extra contribution (maybe $\rho(1450)$ or box-anomaly, maybe both of them) is also necessary

Model-independent fit

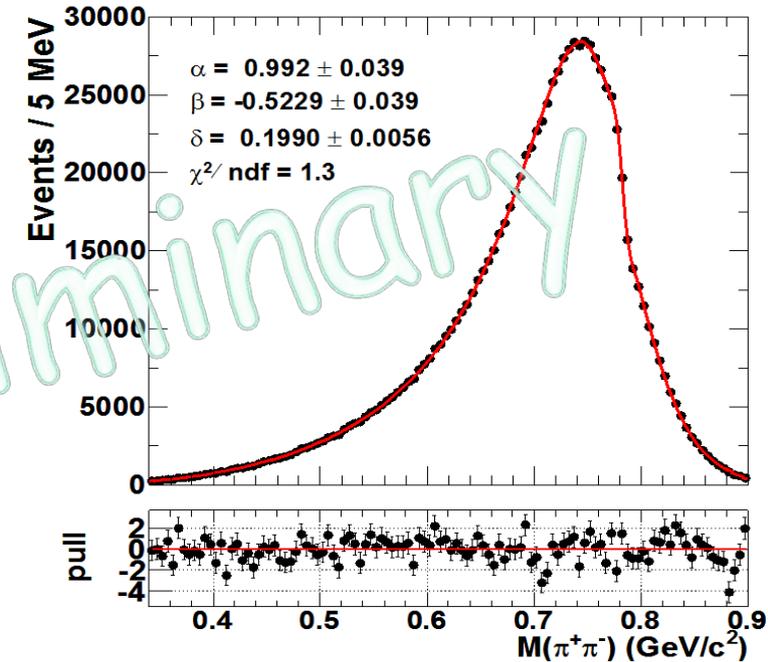

$$\frac{d\Gamma}{ds_{\pi\pi}} = |AP(s_{\pi\pi})F_V(s_{\pi\pi})|^2 \Gamma_0(s_{\pi\pi})$$

$$P(s_{\pi\pi}) = 1 + \alpha s_{\pi\pi} + \beta s_{\pi\pi}^2$$

$$P(s_{\pi\pi}) = 1 + \alpha s_{\pi\pi} + \beta s_{\pi\pi}^2 + \delta BW_\omega$$

Crystal Barrel: $\alpha = (1.80 \pm 0.49 \pm 0.04) \text{GeV}^{-2}$

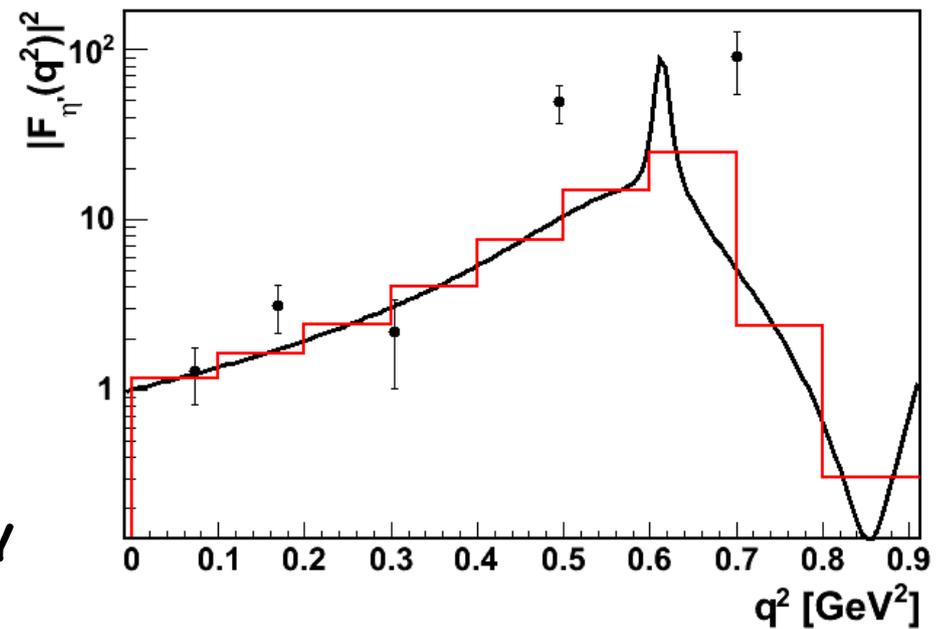

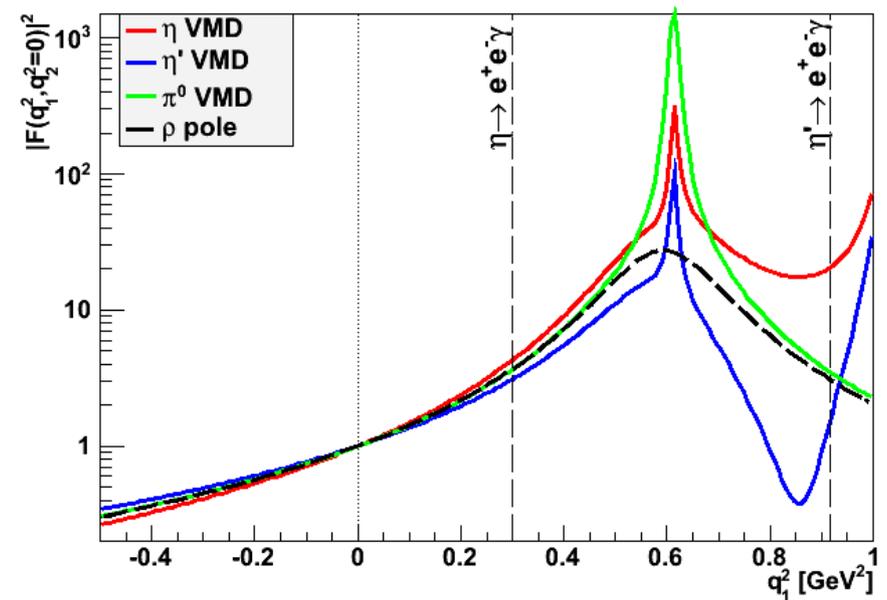

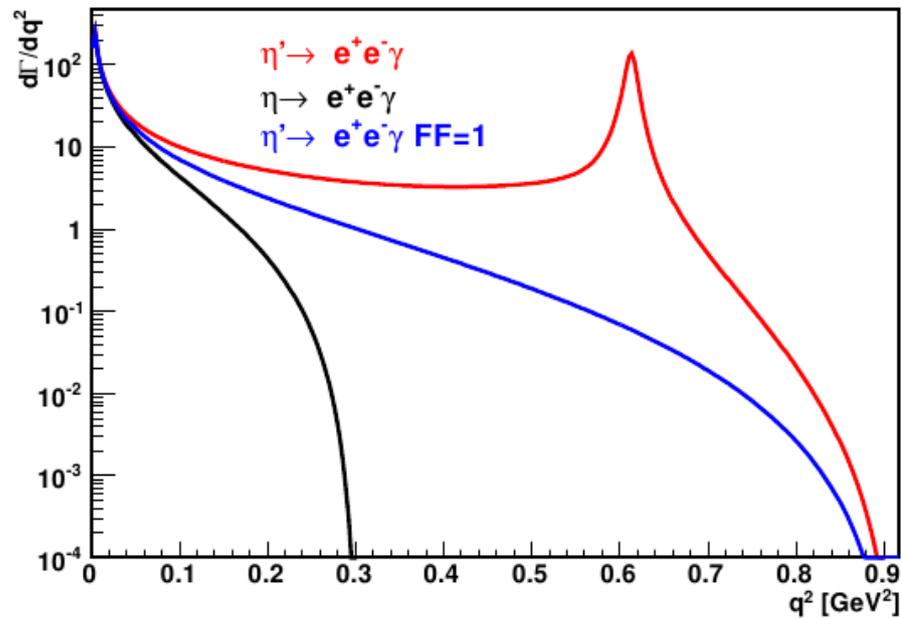

$\beta = (0.04 \pm 0.36 \pm 0.03) \text{GeV}^{-4}$

GAMS-2000: $\alpha = (2.7 \pm 1.0) \text{GeV}^{-2}$

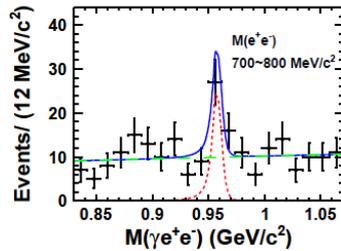

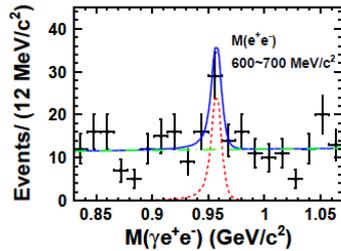

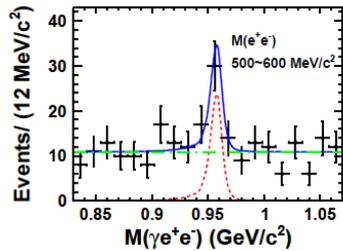

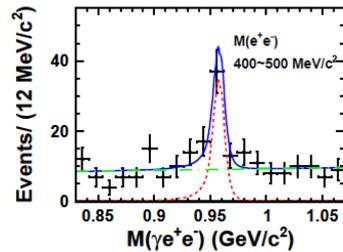

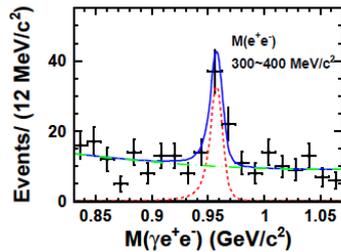

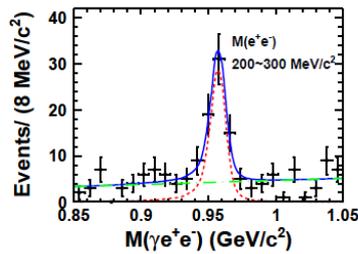

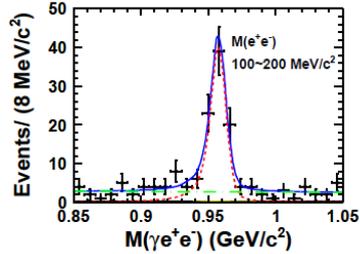

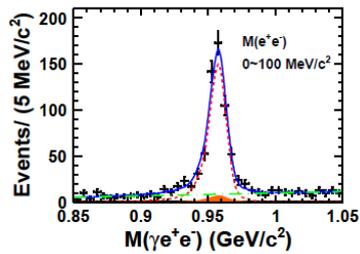

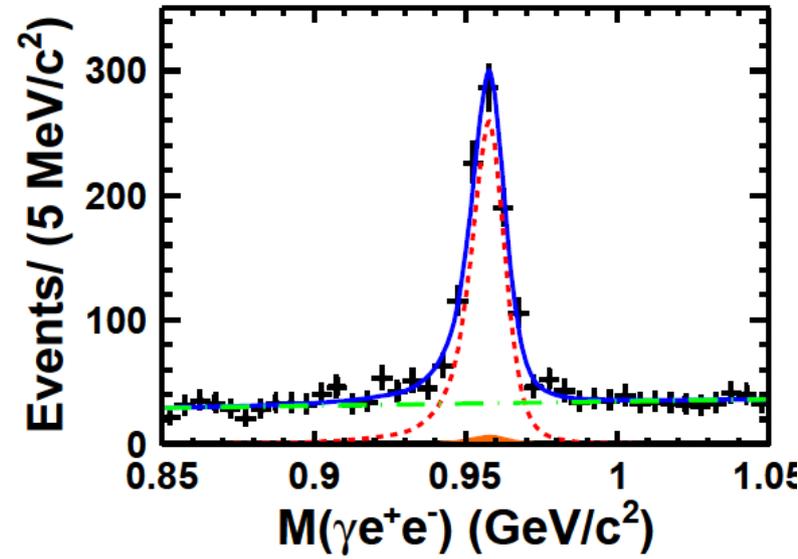

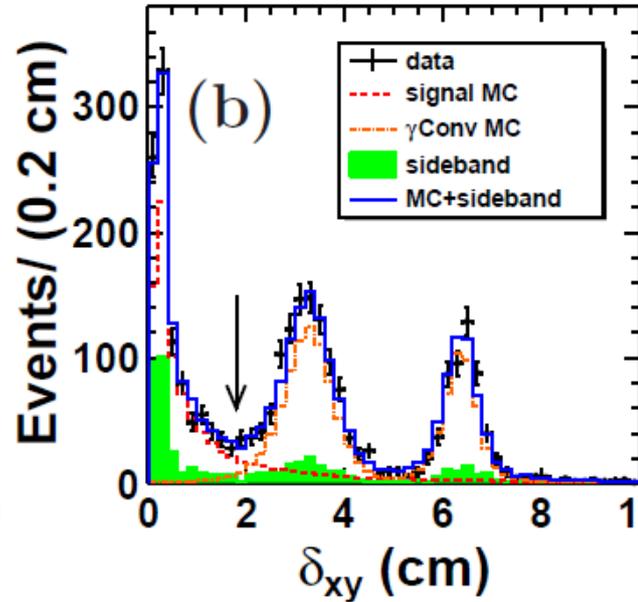

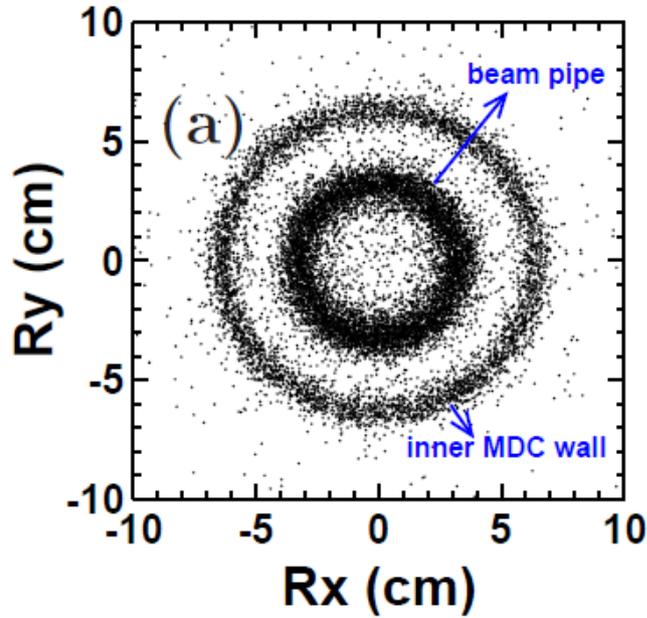

ω contribution is necessary

Linear polynomial is insufficient...

Dalitz decays

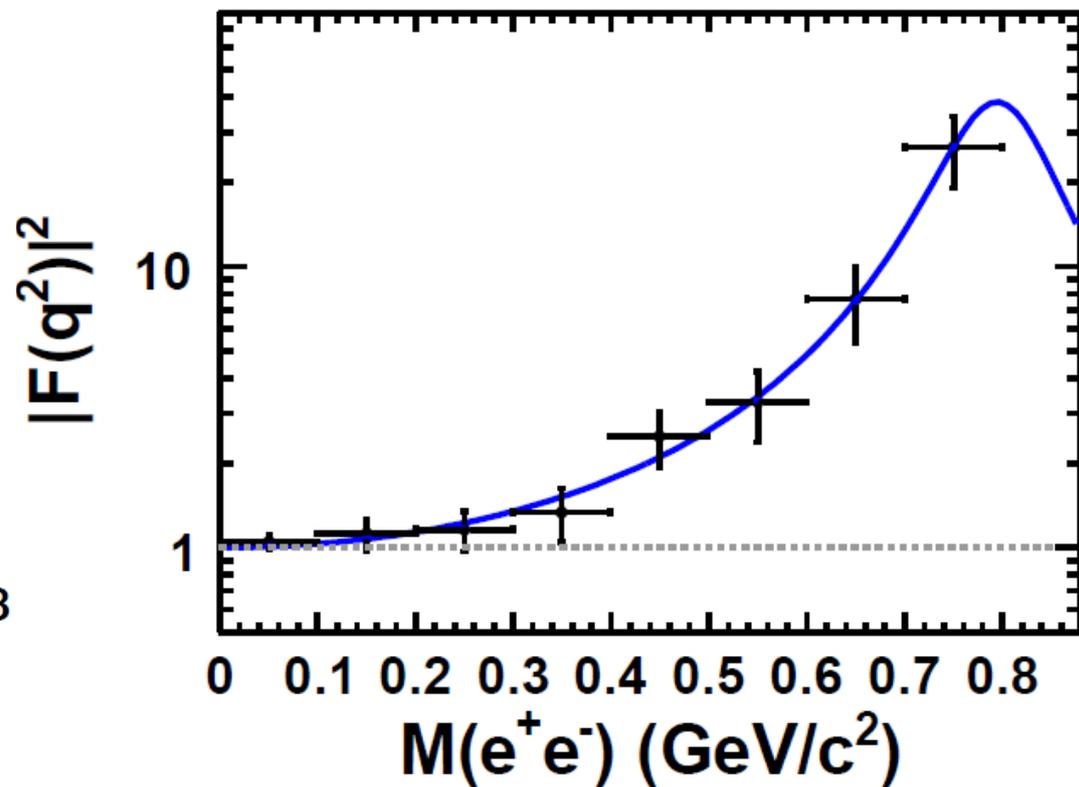

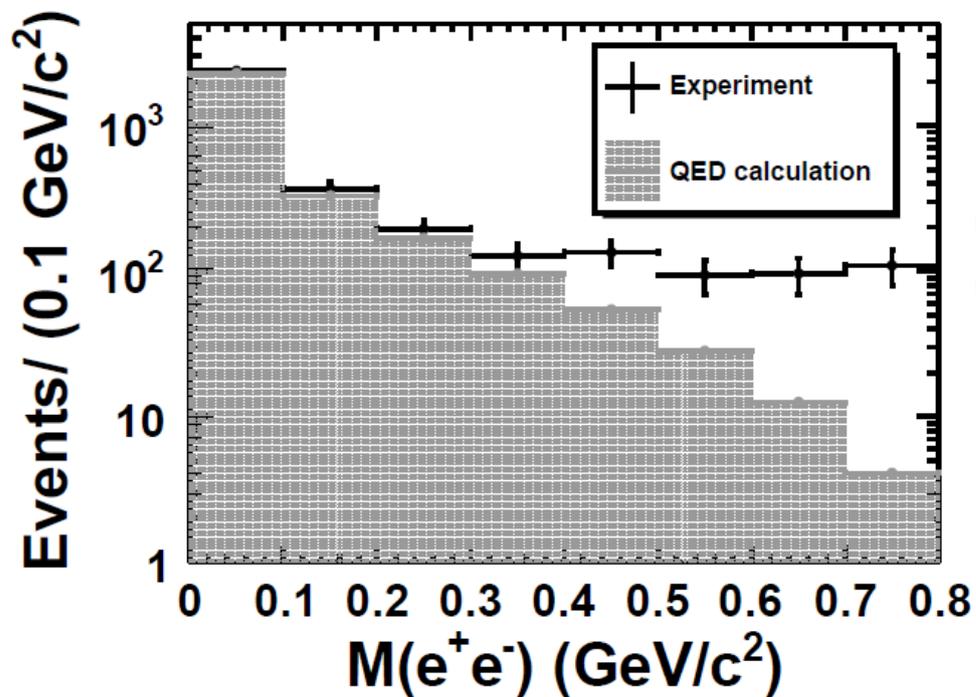

Observation of $\eta' \rightarrow \gamma e^+ e^-$

arXiv:1504.06016

Transition form factor of $\eta' \rightarrow \gamma e^+ e^-$

Summary

- An excellent place to study light hadron spectroscopy (high statistics and low background), complementary to hadro- and photoproduction experiments
- Many interesting results based on 225 M J/ψ and 106 M $\psi(3686)$ data
- Expect much more results with 1.3 B J/ψ and 0.5 B $\psi(3686)$ data
- BESIII is also η' factory
